<u>Tide Correctors</u> ✓ See Eval Rpt, Section 6

Tide correctors were not applied in the field but real tides were applied during office processing from the Elliott Bay tide station data downloaded from headquarters. The operating tide station at

Seattle Washington (944-7130), is located less than 1 NM north of the East Waterway and serves as control for datum determination.

Straight line interpolation of the six-minute tide correctors (based on Mean Lower Low Water) was accomplished using the HDAPS program REAPPLY. Times and heights are direct on the datum station. No anomalous data are apparent, and the printout of the data is included in Appendix V.*
