

C.1 No tidal zoning was used for this survey. Predicted tides were applied to the multi-beam data from tide station Deer Island, Massachusetts (Station ID# 937, based on Boston, MA, 844-3970). Tides were converted with in CARIS-HIPS using the “tideconv” batch program. The predicted tides were converted to UTC time before being applied to the multi-beam data set.

NOTE: DO NOT reapply any correctors to multi-beam data in HPS, including verified smooth tides. Note that only predicted tidal values have been applied to all F-00465 data. Verified smooth tide values and correctors need to be applied to the entire multi-beam set in CARIS-HIPS prior to conversion to HPS. * *Approved*
Tides AND ZONES were Applied in CARIS-HIPS during OFFICE PROCESSING.
