Descriptive Report to Accompany Hydrographic Sheet # 2851 (Field # 15 ). Nantucket Sound, Massachusetts, 1906. Scale:1-20.000

- 1. This sheet embraces the resurvey of Hedge Fence and L'Hommedieu Shoals in the western part of Nantucket Sound; including the extension of the latter shoal to Nobska Point.
- 2. Your instructions of August 21, 1906, under which this work was done, directed that before proceeding with a close re-survey of these shoals an examination be made in order to determine whether the changes were such as to justify a complete re-survey.

  An examination with the ship of the area between the western end of M.'Hommedieu Shoal and Nobska Point, and of the area to the south—westward of this Shoal developed material changes. Launch lines run across Hedge Fence Shoal at intervals of two or three hundred meters gave indications of some slight changes. The question of whether or not to make a close re-survey of the shoals with the launch was not a clear one, but considering the importance of these waters, owing to the great amount of shipping under both sail and steam passing through the Sounds, and considering the fact that it was necessary to do considerable hydrographic work in the vicinity with the ship, my final decision was to proceed with the launch work.
  - 3. The area between L'Hommedieu Shoal and Nobska Point was surveyed with the ship, excepting the very shoal patch between buoys S 17 and C 19, and the eleven foot lump upon which the schooner "Teal" grounded in 1906. The lines were run approximately east and west and are quite close. Owing to strong tidal currents and eddies the lines are very crooked. Two leadsmen were used, sounding alternately from starboard and port chairs. The depth is ir-

regualr over this area and in places there is less water than shown on the chart. As the configuration of the adjacent shoreline is such as to form eddies in this locality, further changes no doubt will take place in the course of time. The northern and southern limits of this work are in deep water with regular bottom.

- 4. The ship work also includes the triangular area lying between buoys 15 and 17 and the western end of Hedge Fence Shoal. There is less water on this bank than shown on the chart. The least depth found is 15 feet at mean low water. The lines extend to the five fathom curve on all sides.
- 5. The lump on which the Teal grounded was carefully investigated, using the whaleboat under oars. This danger is marked by a spar buoy. It is small in extent and the least depth found is 10.8 feet at mean low water. Vessels standing into Falmouth should make due allowance for the current in passing the spar.
- end of Hedge Fence Shoal, but no changes were found. The sounding lines followed the ridge indicated by the chart and extended about 1 1/2 miles eastward from the spar buoy. I was told by a resident of Vineyard Haven, believed to be reliable, that lumps form in the vicinity of Hedge Fence Shoal and later disappear.
- 7. A number of ship lines were run off the eastern end of L'Hommedieu Shoal, but the soundings here developed nothing new. It was my intention to make a careful examination of the 16 and 9 foot spots shown between the eastern end of L'Hommedieu Shoal and Succonesset Shoal, but bad weather prevented this being done. Some lines were run across the 16 foot lump but there probably is less water than the soundings on these lines indicate.
  - 8. Hedge Fence Shoal. L'Hommedieu Shoal and the patch be-

tween buoys S 17 and C 19 were developed with the launch. The lines were run approximately at right angles to the length of the respective shoals and they are fairly close. Additional lines would have been run however, had the length of the season permitted. A small portion at the eastern end of L'Hommedieu Shoal was left unfinished. It would have required but a few days more of good weather, but the season was already well advanced for work in this latitude, and the weather was very unfavorable. The unfinished portion is unimportant.

- 9. The positions on this sheet depend chiefly upon objects previously determined by triangulation. Two or three signals were erected, and these together with one or two prominent objects were cut in by sextant angles observed on board and on shore. These angles will be found in the sounding records. Buoys in the vicinity of the hydrographic work were determined by sextant angles and these angles will also be found in the sounding records.
- 10. The tidal reductions for this work depend upon the readings made in Vineyard Haven Harbor. The plane of reference is mean low water derived from the tidal observations made by the party of C. P. Perkins, U. S. N. Assistant, C. & G. Survey, in 1887. The sheet is transmitted to the office with only a portion of the positions plotted.
- ment of chart # 112: More topography should be shown, especially the configuration of the more important hills. Among the prominent objects that should be shown on the chart are, the Falmouth stand pipe, "Fal" ( prominent building with cupola standing on bluff at Falmouth ) Lagoon Heights stand pipe, Vineyard Haven stand pipe and Makonikey hotel. Hydrographic signal "Wind" is a tall windmill standing beside a prominent white house (western side) and the two

should be shown on the chart. The rear object of the range leading into New Bedford harbor is not a stand pipe as indicated on this chart, but an elevated tank supported upon a steel framework. There is a tall and prominent factory chimney near this range, which in thick weather might readily be taken for a stand pipe.

- 12. For the use of vessels going into Vineyard Haven from the Sound, the Marine Hospital and the more important buildings of the town (town hall for instance) should be shown. As there are no dangers in the harbor, chart # 112 might be readily be used for going in without the necessity of looking up the harbor plan.
- vard Haven would materially assist vessels coming in at night. During the time that the Explorer was in the vicinity a fixed red light was exhibited from the flag staff at the Marine Hospital by the hospital authorities, but its light was too faint to be of much assistance to vessels. Vineyard Haven is quite an important harbor of refuge and temporary anchorage for sailing vessels and tugs with tows.
- 14. Lombards Cove (chart 112) should be Lamberts Cove.

  \*Kopeecon\* Point doubtless is a corruption of Cape Higgon.

Respectfully.submitted.

Assistant, C. & G. Survey,

Chief of Party.
