#### MARYLAND OYSCER SURVEY

ORNTIFIED INCISCULON 1 1907 Somerset County

Natural Cyster Bars, Crab Bottons Clam Bods and Princedistics Stations

a world of a work of a ware work

#### surveyed by

MARYLAND SHELL FISH COMMISSION U.S. BURBAU OF FISHERIES U.S. COAST AND GEODETIC SURVEY

## Scale 1/10,000

#### -Explanation

The primary object of the work covered by the projections of the Maryland Cyster Survey was the gathering of informatics for the purposes of an "cyster survey." Consequently these sheets do not fulfill the requirements of an ordinary hydrographic survey. But it is intended that they shall be used for all future plottings of the hydrography contained in the records of SONDINCE of the Maryland Opter Survey filed in Archives.

In general, the lines of soundings only over the vicinity of the intural oyster bask outlined in green hat on these projections, and therefore, it will be usaless to plot the soundings unless information is desired for these particular identities. For the same reason, the boundaries of the Natural Cyster Harmishown on the Maryland Cyster Survey Charts, Nos. 1 to 45 published by the U.S. Const and Geodetic Survey, can be used as a general index of the limits of the hydrography of the Maryland Cyster Survey.

For descriptive report see U. S. Const and Geodetic Survey publications "Summary of Survey of Cyster Sers of Maryland" and "Survey of Cyster Sere, Somerset Dounty, Maryland," and for limits of related projections see progress and in the latter publications......

Boundaries of Natural Cyster Bors are indicated by green lines.

Soundaries of Crab Bottoms, when on projections, are indicated by blue lines. Boundaries of Clam Beds, when on projections, are indicated by yellow lines. Triangulation Stations are indicated by small red triangles.

This projection is due of a sories of eighty-seress original certified projections of all syster bar and other boundaries established by the Enryland Cyster Survey and was filed in the Archives by C. C. Yates, representative of the U. S. Coast and Codetic Survey on the work of the Maryland Oyster Survey.

MARYLAND SHELL FISH COMMISSION Swepson Earle, Hydrographic Engineer

\*\*\*\*\*\*\*\*\*

1907

MOTES: The primary object of the work covered by these statistics, was the furnishing of information for the purposes of the "Oyster Survey". Consequently the hydrography does not necessarily fulfill all the requirements of cusomary hydrographic operations.

\*\*\*\*\*\*\*\*\*\*\*\*\*\*

In general, the lines of soundings only cover the area of the natural oyster bars as indicated on the projections in green ink; and therefore, it will be useless to plot up a sheet for hydrographic information unless the waters in question are included in these oyster bar boundaries.

\*\*\*\*\*\*\*\*\*\*\*\*\*\*\*\*\*\*

For Progress Map showing scheme of projections, etc., ace published report of Survey of Cyster Bars, Somerset County Maryland and Descriptive Report in Archives.

\*\*\*\*\*\*\*\*\*\*\*\*\*

For Index showing relation of sounding and tidal records with projections, see the following statistics.

\*\*\*\*\*\*\*\*

For purposes of the "Oyster Survey" several well established rules of the Coast and Geodetic Survey as to the manner and method of taking soundings have been modified or omitted in the sounding records. Notably, the jumping about from book to book without reference to the limits of the projections, the use of a "book letter" in addition to a volume number, and the substitution of letters and angle numbers by volume for letters and angle numbers by day. However, no difficulty will be experienced in plotting the work if the combined statistics, index and explanation attached to Volume I and to each projection is consulted.

\*\*\*\*\*\*

# EXPLANATION

These Statistics and Index cover all hydrography executed in connection with the "Cyster Survey" in Somerset County and adjacent waters of Maryland. All this work is contained in the sounding and tidal records on file in the Archives of the Survey, but only a part of it has been plotted on the projections. For purposes of an index to the hydrographic work, the boundary lines of cyster bars as shown on charts of cyster bars of Somerset County and Adjacent Waters" published by the Survey, indicate very closely the area covered by soundings. Hence, it will not be necessary to plot up any of the hydrography covered by these statistics, UKLESS IT IS DESIRED TO INVESTIGATE THE WATERS INCLUDED IN THE OYSTER BOUNDARY LINES AS SHOWN ON THE PUBLISHED CHARTS OF CYSTER BARS.

The following tables are self explanatory except as to column 2 and 3. The second column ( under heading C.& G.S. Day Letter) gives the day letter as customarily used in the Survey, but the different colors, stated in parenthesis at the head of the column, indicate different series of alphabets not different sounding boats. The third column (under heading of M.S.F.C. Book Letter) gives the book letter of the Maryland Shell Fish Counission. This was adopted by the M.S.F.C. for purposes of their own. It really has no meaning except as an additional symbol for the volume number ( Vol. No.) given in the 4th column. In this connection, attention is called to the fact that there are two sets of angle numbers in the sounding records. The ones in black pencil are poculiar to the book letter system described above, and occupy the ordinsrymposition of day angle numbers. The ones in colored pencil are the day angle numbers of the C.& G.S. and they occupy the column in the sounding record headed up " Boat head by Compass". These colored numbers correspond to such positions as were plotted on the projections, and are the ones that should be used in any future plotting that may be done on the sheets.

Attention is also called to another feature of the sounding records;-In the column under heading of "Remarks" one of the capital letters B, S, M, or D, occur opposite each sounding. These letters refer to the indications of the oyster shell character of the bottom as shown by vibration of a wire to which is attached a chain dragged over the bottom. This chain causes the wire to vibrate in proportion to the number of shells it is passing over, and the observer with his hand on the wire calls out at each sounding, the character of the bottom the vibrations indicate. For no vibrations the words "barren of shells" are used(B); occasional vibrations are named "scattering shells" (S); frequent vibrations are named " medium amount of shells" (M); and continuous vibrations and jorks are named " dense amount of shells" (D).

The "Miles of sounding lines" given in the sounding records at the end of each days work and those given on the labels of the books are in nautical miles; although the following statistics give the "statute miles" for each day, as is customary in the Survey.

In addition to the usual contents of tabular statistics, there has been added a column under the heading "Tide Vol. No.", which gives the "series numbers" of the tide record volume of Somerset County used in the reduction of soundings of the sounding record indicated on the same line of the table. These tide volume numbers are given on the bottom of the label of the tidal records and are in addition to the customary number which indicates merely the volume of tidal observations at one particular station. The following table shows the relation between the customary station number of the Tide Record Volumes and the " series numbers" given in these statistics.
