HYDROGRAPHERS

A. PROJECT GS-343 - Instructions dated 6 March 1951 with supplemental instructions of 1 August 1951 (Directors ltr. of 1 Aug 51 file S-1-PF)

B. SURVEY LIMITS AND DATES - That portion of the Bering Sea Area from St. Paul Island westward, to a line five (5) nautical miles southeast of and parallel to the line of demarcation established by the Conference of 1867 between the United States and Russia, and northward to Latitude 59°-40. The western limit was later changed to a line fifty (50) nautical miles southeast of and parallel to the line of demarcation. The survey is joined on the east by surveys H-7950 and H-7949, both at 1/500,000 scale and H-7948, scale 1/40,000. All are incomplete contemporary surveys. There are no previous surveys of this area. Field work began 10 July 1951 and ended 3 September 1951.

C. VESSEL AND EQUIPMENT - The major part of the sounding accomplished was done by USC&GSS PATHFINDER as EPI controlled hydrography. The vessel operated primarily at standard speed (115 rpm) with reductions to 2/3 speed (75 rpm) when Bathythermograph observations were being made. On one occasion heavy seas necessitated slowing the vessel to 100 rpm for a short period. The turning radius of the Ship PATHFINDER is estimated to be 200 meters at standard speed of 115 rpm.

Sounding equipment used on this survey by the PATHFINDER was; 808 type Fathometer No. 130-S, N.J.-3 Type Fathometer No. 22, and NMB-1 type Fathometer No. 106. The depths at which these instruments were generally used are tabulated below.

808 type	0 to 155	fathoms
NJ-3	155 to 400	fathoms
NMB-1	400 to 1200	fathoms

Several sounding lines in the southeast part of the area were accomplished by USC&GSS EXPLORER. A brief report by C.O. EXPLORER is included in this report.

D. TIDES AND CURRENTS - A Standard Automatic Tide Gage was maintained at Dutch Harbor, Amaknak Island, Alaska, and a Portable Automatic Tide Gage was maintained at Village Cove, St Paul Island, Alaska, during the period of the field work. For the purpose of reducing soundings the Dutch Harbor tide gage was used as a reference station. The survey area was zoned according to the tidal zoning system devised by the Washington Office and corrections for time and range differences were applied accordingly. (Reference: Director's letter 36 kh, Subject- "Tide Reducers, Bering Sea, 1951", 15 Oct 1951.

A copy of the applicable Tide Zone Diagram is included in this report. Range factors applied vary from 0.5 to 1.0 and time corrections from 0.0 to + 2.0 hours.

No current stations were occupied within the area of the survey.

E. THE SMOOTH SHEET was constructed by hand at the Seattle Processing Office in accordance with conventional methods. The scale of the Boat Sheet is 1:400 000; the scale of the Smooth Sheet was changed to 1:500 000 to reduce the overall size of the sheet to 36 by 60 inches. Boat and Smooth Sheets cover the same areas.

EPI distance circles constructed on the Smooth Sheet are arcs of circles drawn through the plotted positions of selected points on the circles for which geographic positions have been computed. Except for ease of construction, the Polyconic Projection is not well adapted to coverage of areas of the extent of this sheet. Scale distortion along the meridian when more than 3° of longitude away from the central meridian is such that distance arcs are no longer true circles and the geographic positions of numerous points on the arc must be computed in order to delineate the curve with sufficient accuracy for plotting purposes.

F. CONTROL STATIONS - All hydrography accomplished on this survey was controlled by Electronic Position Indicator distance measurements using EPI Ground Stations "B", "E", and "D". These stations were located by triangulation connections and EPI line measurements by PATHFINDER and EXPLORER during the season. EPI "D" was located by triangulation based on the NA 1927 Datum by the party of M.J. Tonkel in 1951. EPI "B" and EPI "E" were located by trilateration using EPI line measurements to control stations on the NA 1927 Datum. The positions plotted on the smooth sheet were furnished by the Washington Office and are from incompletely adjusted positions of the control triangulation. The final adjustment of the control triangulation was not complete at the time the smooth sheet was constructed. (Reference: Director's letter 22/MEK, S-1-PF, Subject-"Report on Adjustment of EPI Observations", 7 Nov 1951).

G. SHORELINE AND TOPOGRAPHY.-- Shoreline and topography have been omitted from the smooth sheet in accordance with Section 151 of the Hydrographic Manual, Paragraph (c). St. Paul Island, Otter Island and Walrus Island, the features so omitted, are in the area common to H-7948, scale 1:40,000.

H. SOUNDINGS - Fathometer velocity corrections, as such, have not been applied to the soundings recorded during this survey. (Reference: Director's ltr. 21/MEK S-1-PF, "Fathometer Corrections Alaska", 21 June 51). 808 type Fathometer No. 130-S, used on this Survey, was converted to a calibration velocity of 800 fathoms per second on 16 July 1951. Soundings recorded prior to that time have been corrected for the change in calibration velocity from 820 to 800 fathoms per second. NJ-3 fathometer No. 22 and NMB-1 fathometer No. 106 were initially controlled to a velocity of 800 fathoms per second and no velocity corrections were applied to soundings recorded by these fathometers. The corrections for calibration velocity of the 808 type fathometer No. 130-S have been designated "CVC", in the sounding record, and apply only to "A" day, positions 1 to 4 inclusive.

Instrumental Corrections for 808 type fathometer No. 130-S have been deduced from numerous Simultaneous Comparisons and Phase Comparisons taken throughout the season. Instrumental Corrections for NJ-3 fathometer No. 22 present a different problem since the major part of the error appears to result from variations in frequency of the line voltage from the designed frequency of 60 cycles per second. Prior to the use of the NJ-3 fathometer on this survey, a frequency meter was installed in the power circuit and an attempt was made to regulate the frequency within a comparatively narrow range. Frequent checks were made of the transmitted signal cycle. The attempt was partially successful; variations in frequency of line voltage were reduced to the extent that variation in timing of the emitted signal from the designed frequency of one per second were held to a maximum of -1.33% and an average of -0.86%. These divergences in the timing cycle of the emitted signal correspond to errors of  $\pm 1.35\%$  and  $\pm 0.90\%$  of the registered depth, respectively. Corrections have been computed from frequent timing checks noted and applied to the recorded soundings. The indicated accuracy of the computed corrections within 0.33% of the observed depths.

No instrumental corrections have been applied to the soundings taken by the NMB-1 fathometer No. 106, used for depths over 400 fathoms. The indicated instrumental correction for this fathometer is approximately 1 fathom, which is less than the uncertainty in scaling soundings from the graph.

All instrumental corrections applied have been entered in the Sounding Records in the correction column headed "Echo Correction".

Draft corrections have been applied to the recorded soundings when warranted. Since the vessel was sounding continuously, the fathometer initials were maintained at a constant setting of 2.0 fathoms and the change in mid-ship draft plotted as a graph from draft readings taken at intervals. The algebraic differences between 2.0 fathoms and the instantaneous draft have been entered as corrections in the correction column headed "Draft".

Initial corrections, that is the difference in the value on the fathomgram and the adopted value of 2.0 fathoms, were applied at the time the fathomgrams were scanned and have not been separately entered in the Sounding Record.

Settlement and squat corrections have not been applied since no value has ever been determined for USC&GSS PATHFINDER. However, the combined effect of settlement and squat is estimated to be not greatly in excess of 0.1 fathoms.

For detailed information concerning the derivation of the corrections discussed, reference should be made to the report, "Fathometer Corrections 1951, USC&GSS PATHFINDER", forwarded separately.

I. CONTROL OF HYDROGRAPHY - Hydrography was controlled by EPI distance measurements from two stations for each fix. The observed EPI distances have been adjusted by applying corrections derived from simultaneous EPI and Shoran measurements observed at intervals during the season. For information concerning the derivation of these corrections reference should be made to letter Commanding Officer PATHFINDER 426/CP/gaa, 24 October 1951, "EPI and Shoran Corrections", a copy of which is attached.

J. ADEQUACY OF SURVEY - The survey of this area is incomplete. Sounding in the area of the reported 8 and 13 fathom shoals, at Latitude  $58^{\circ} 30' N$ , Longitude  $175^{\circ} 16' W$ , on H. O. Chart No. 0068, was partially accomplished. No indication of the shoal was noted but additional development is required. It is recommended that the charted soundings be retained pending further investigation. The 100 fathom curve was partially delineated but is not completely developed.

*Disregard reported 8 & 13 fms. These depths considered adequately discredited in area investigated*

No junctions were made with adjoining surveys.

*Chief of Div RHC 9/2/67  
L.G. Taylor concurred*

Sounding done thus far does not clearly define all applicable depth curves in the area.

*5/15/67*

K. CROSSLINES - One line in the system completed may be considered a crossline. This line makes eight (8) crossings and was run approximately normal to the principal system of lines in the investigation of the reported shoal soundings at Latitude  $58^{\circ} 30' N$ , Longitude  $175^{\circ} 16' W$ . The crossline amounts to 12.5 per cent of the principal system in the area. Discrepancies in crossings range from 0.0 to 2.1 per cent. The discrepancies are explicable in that the crossings were over steep slopes in an area of bold bottom relief.

L. COMPARISON WITH PREVIOUS SURVEYS - There are no previous surveys by the Bureau in the area.

M. COMPARISON WITH CHART - Two charts cover the area of the Survey. These are C&G S Chart No. 9302, First Edition, 1900, and H. O. Chart No. 0068, First Edition, 1917. In addition, part of the survey area in the vicinity of St. Paul Island is covered by C&G S Chart No. 8996, First Edition, 1909. Reference should be made to the descriptive report accompanying H-7948 for comparison in this area.

Comparison with C&GS Chart 9302 and H O Chart 0068 is not significant because of the small number of charted soundings in the western part of the survey area and the incomplete nature of the present survey. The hydrography completed indicates some displacement of the 100 fathom curve from that charted. The reported 8 and 13 fathom soundings at Latitude 58°-30' N, Longitude 175°- 16' W, were not found but the hydrographic coverage is inadequate to disprove the charted depths.

*8 and 13 considered adequately discredited. EHC Chief of Div. L & Taylor concurred 5/15/67*

N. DANGERS AND SHOALS - The following listed shoal depths are in the area common to the incomplete contemporary survey H-7948 (PF4151) which should be consulted for detailed information.

Latitude	Longitude	Least Depth (Fms)
57° - 18.5' N	169° - 59.0' W	5.8
57° - 03.7' N	170° - 19.5' W	6.3
57° - 10.6' N	170° - 38.6' W	3.0

O. COAST PILOT INFORMATION - The Descriptive Report accompanying Hydrographic Survey H-7948 and Coast Pilot notes previously submitted should be consulted for applicable information under this heading.

P. AIDS TO NAVIGATION - No Aids to Navigation are maintained within the area of this survey.

Z. TABULATION OF APPLICABLE DATA -

1. Submitted with this report:  
Report to accompany H-7951 (EX-PF 40351), USC&GSS EXPLORER
2. Submitted separately:  
Report to accompany Hydrographic Survey H-7948 (PF 4151)  
Fathometer Corrections 1951

REPORT TO ACCOMPANY H-7951 (EX-PF-40351)

USC&GSSHIP EXPLORER  
George L. Anderson, Comdg.

1951

During the field season, all work in this area was plotted on either the EX-40151 or EX-40251 boat sheet. (H-7949 or H-7950.)

After the changes in scale and limits of the smooth sheets H-7949, H-7950, and H-7951, the following small segments of hydrography fell within the limits of neither H-7949 nor H-7950 (40151 and 40251), and so were plotted on H-7951.

Day	Positions	Original sheet
P	10-16	H-7950 (EX-40251)
Z	1-4	H-7949 (EX-40151)
HA	18-21	H-7950 (EX-40251)
JA	1-16	H-7950 (EX-40251)
QA	1-5	H-7949 (EX-40151)

Since the quantity of hydrography accomplished on this sheet was so small, there will be no formal descriptive report submitted. For methods of control, soundings, corrections, etc., see Descriptive Reports to accompany sheets H-7949 and H-7950.

Since the proper EPI circles were not on sheet H-7951, positions 1-4Z were plotted on a dog-ear from sheet H-7949, and then transferred to sheet H-7951 by means of a tracing. The tracing will accompany the smooth sheet for H-7951.

Respectfully submitted,

William D. Barbee  
Ensign, USC&GS

Approved and Forwarded:

## TIDE NOTE

A Standard Automatic Tide Gage was maintained at Dutch Harbor at Latitude 53 53.6N, Longitude 166 32.1W. Three point three (3.3) feet on the staff was mean lower low water. Tide curves were plotted from the hourly heights furnished by the Washington Office. Correction for time and height differences were applied in accordance with the Tide Zone Diagram as furnished by the Washington Office.

Corrections to be applied to 808 fathometer readings only before July 16, 1951.

Refer to File  
426/CP/gaa

24 October 1951

To: The Director  
U. S. Coast and Geodetic Survey  
Dept. of Commerce Bldg.

Subject: EPI and shoran corrections

Reference: My letters dated 17 July 1951 (426/CP/gaa) and 3 August 1951

There are forwarded abstracts of shoran and EPI corrections by the PATHFINDER subsequent to 1 August 1951. An abstract of all corrections obtained prior to 1 August 1951 were forwarded with my letters described under reference. There is also forwarded an abstract of a few line measurements made from the ship at anchor.

It is noted that the final shoran corrections at EPI BAKER and EPI EASY increase the "Zero Set" by 0.009 and 0.012 statute miles from the values obtained early in the season. The final shoran corrections have not been meaned with the earlier corrections for deriving EPI corrections to apply to positions on the hydrography because the change in microseconds would be too small to affect the plotting of any position on a scale of 1/400,000.

No final shoran correction was obtained on the equipment at EPI DOG. (Nunivak Island) because weather conditions prevented doing so. A preliminary value of the shoran correction for the shore equipment used at Nunivak Island and the ship equipment as calibrated in Seattle in October furnished a value within 0.006 statute miles of the shoran correction submitted with my letter of 17 July 1951 and which was used in computing the length measurements in the Bering Sea.

Shoran calibration observations taken on equipment at EPI DOG on 10 June and 8 July show considerable range in individual values when finally plotted on an aluminum mounted sheet and using geodetic positions furnished in September by Norman Sylar. However, the value submitted to Washington on the 17th of July, 1950 agree within 0.01 statute miles which variation will have no sensible effect on the computations of lengths involving EPI DOG.

The EPI corrections derived from shoran comparisons for the several shore stations appear to be reasonably consistent throughout the season. The exception to this occurred at EPI BAKER on 2 August when EPI corrections increased about 1.6 microseconds from the mean of values derived prior to this date. This has been attributed to changes in the modulator and transmitter at the shore station but it is noted that on the 19th of August the correction decreased again in agreement with to the early season values.

The method followed aboard the PATHFINDER for determining the EPI corrections by comparison with shoran readings was as follows: Place the ship on a bearing

normal to the line between the EPI and shoran transmitters by EPI control and at a distance close to the maximum range of the shoran equipment. Run this normal line at 1/3 speed taking simultaneous readings of the shoran and EPI distances at regular intervals. Twenty such readings are usually taken. After completion of this set, shift from the "A" to the "B" side of the ships "Scope" and taken 20 additional readings. The mean of each set of readings is used for computing the EPI correction. The individual shoran and EPI distance readings can be plotted and any wild values rejected. It is considered worth the time on EPI calibration tests to make the comparisons on both the A and B sides of the scope if for no other reason than to serve as a check on the particular observation. ZERO checks on the ship EPI equipment during the season showed the "B" side of the scope to be 0.3 microseconds bigger than the A side.

Reference has frequently been made in the abstract of shoran and EPI calibration forwarded to Washington to the "Calibration volume". This work book has been retained aboard and contains all the observational data for shoran and EPI corrections calibrations. All data has been checked.

Information is requested whether this calibration volume is desired in Washington. If not it will be retained aboard for reference purposes next season.

All line crossing observations, length determinations at anchor and metrol-ogical data for line crossings are entered in sounding volumes which have been forwarded to Washington.

APPROVAL SHEET

Hydrographic Survey H- 7951 ( PF- 40351)

The field work was done under my immediate supervision and the Boat Sheet was frequently inspected as the work progressed.

The survey is incomplete; only a small part of the area has been sounded. The additional work necessary to complete the survey is recommended.

The completed smooth plot of hydrography so far accomplished and the accompanying records have been examined by me and are approved.

Charles Pierce  
Chief of Party

Background information  
pertaining to reported  
8 & 13 fms

(7406) BRITISH COLUMBIA—Queen Charlotte Sound—Egg Island—Light reestablished.—Egg Island Light has been reestablished showing flashing white every 15 seconds. The light is now exhibited at an elevation of 94 feet from a red iron lantern on a tower above a white rectangular concrete building.

Approx. position: 51°15' N., 127°50' W.

Note.—The temporary light has been discontinued.

MEMORANDUM

From: Mr. M. Magnusen  
To: Mr. Englebrecht

1. Attached is a copy of a portion of the report of a training patrol by the submarine USS BERGALL in 1947 as requested by your telephone call of 2 May 1967.
2. Method of obtaining position is not given in most instances; however, the summary states: "In the Bering Sea area, navigation was largely by Loran, with only fair results."

*M. Magnusen*  
M. Magnusen

Subject: U.S.S. BERGALL (SS320) - Report of First Training Patrol

1250 (X) Submerged to 300 feet for BT card and trim. Commenced battery discharge at the 6 hour rate.

1915 (X) Surfaced, battery discharge completed. 99.4% capacity.

2100 (X) Star sights.

2119 (X) Sent BERGALL Serial SIXTY-ONE to ComSubPac.

Ship icing. Temperature 29<sup>o</sup>F.

19 April 1947

0030 (X) Number 3 FBT dry, converted it to a main ballast tank.

0545 (X) Submerged for 12 hour dive. Went to 300 feet to obtain BT card. During day held depth control drills and schools.

0735 (X) Sighted a small floe of drift ice sharp on port bow about 2000 yards. Came right to clear it. Ice appeared to be moving in a southerly direction at about 2 knots.

1200 (X) POSIT: LAT. 59-02.0 N. LONG. 175-39.0 W

1741 (X) Made battle surface. Average CO<sub>2</sub>, 2.7%. One can (15 pounds) CO<sub>2</sub> absorbent used.

1746 (X) Secured from battle stations, surface.

1812 (X) Sent VP-AM1 our 202000Z predicted posit and told them that this would be the last day we needed them.

2145 (X) Sent BERGALL Serial SIXTY-FOUR to ComSubPac.

2330 (X) Bottom began shoaling rapidly from 35 fathoms.

2335 (X) Passed over 8 fathom shoal. POSIT: LAT. 58-30.5 N. LONG. 175-20.0 W. Stopped to break out leadline to verify reading, leadline frozen tight in topside locker. Decided to accept fathometer reading, and pulled clear slowly. This position is shown on USC&GS chart 9302 as being five miles

Subject: U.S.S. BERGALL (SS320) - Report of First Training Patrol  
outside the 1000 fathom curve.

20 April 1947

- 0005 (X) Resumed course, water deepening.
- 0427 (X) Passed over bank again, least depth 13 fathoms. Position Lat. 58-30.5N, Long. 175-09.0W. This apparently is continuation of same bank experienced last night. Water deepened rapidly to 250 fathoms on course 027T.
- 0740 (X) Sighted ice floe 010<sup>0</sup>T distant 5 miles. Radar has been unable to pick these up, as they are fairly low in the water.
- 0813 (X) Began ice shoot, all guns slightly iced but melting slowly. Both 5 inch guns registered hits at about 2000 yards. 40 MM pistols and machine guns stopped the near cubes cold. All guns functioned satisfactorily except as noted in remarks, paragraph (V).
- 0831 (X) Shooting over, ammunition expended: 5 inch - 20 rounds; 40MM - 64 rounds; 50 cal. - 220 rounds; 30 cal. - 100 rounds; 45 cal. - 50 rounds.
- 0936 (X) Took surface BT reading. Isothermal to 450 feet.
- 0950 (X) VP-AM1 tells us that he must have more advanced notice of our requirements and that he is unable to send a plane today. Evidently he did not receive our message of 1812(X) yesterday.
- 1022 (X) Sent message to VP-AM1 telling him we would not require his services anymore.
- 1200 (X) POSIT: LAT. 58-30 ON Long. 174-40.0 W
- 1415 (X) Small arms practice using ice cubes and cans as targets.

DESCRIPTIVE REPORT TO ACCOMPANY HYDROGRAPHIC SURVEY

H-7951

(PI-503-52)

CENTRAL BERING SEA

Project CS-343  
Ship PIONEER  
Scale 1:500,000

Season of 1952  
Thos. B. Reed, Chief of Party  
Surveyed by Ship's Officers

A. PROJECT

The work was done in accordance with instructions for Project CS-343 dated 6 March 1951, 28 May 1951, 21 June 1951, and 21 March 1952.

B. SURVEY LIMITS AND DATES

The survey covered the area between latitudes  $56^{\circ} 00'$  and  $56^{\circ} 45'$  and between longitudes  $170^{\circ} 05'E$  and  $177^{\circ} 00'E$ . This sheet was not completed and work in the remaining area to the north will be continued at a later date.

This sheet was begun in 1951 by the PATHFINDER at which time a meander line was run in a northwesterly direction. The 1952 work crosses this line three times with good agreement at each crossing.

To the east this sheet makes a junction with PF-401-51, completed by the PATHFINDER in 1952.

Junctions were also made with contemporary surveys H-7993 on the west and H-7973 on the south.

Hydrography was begun 20 August and ended 24 August, 1952.

C. VESSEL AND EQUIPMENT.

The hydrography was performed exclusively by the Ship PIONEER.

The NMC fathometer, serial number I-766 was used in depths over 400 fathoms. In depths less than 400 fathoms the NMC-2 fathometer, serial number 117 was used. The 808 fathometer, serial number S-108 was used simultaneously with the NMC-2 in depths less than 100 fathoms.

The turning radius of the ship was approximately 400 meters.

D. TIDE AND CURRENT STATIONS.

No tide or current stations were used in connection with this survey.

E. SMOOTH SHEET

The smooth sheet was drawn in 1951, by the Seattle Processing Office. All the EPI arcs were also drawn in 1951 with the exception of the SEGuam arcs. These were drawn on the Ship PIONEER by computation of points on the arcs.

F. CONTROL STATIONS

EPI station PAUL was located in 1951 and the same location was used for this survey.

EPI station SEGuam was located by triangulation by personnel from the Ship PIONEER. All stations used in its location were established by the Coast and Geodetic Survey and are on the 1927 datum. For details see Special Report, "Computation of EPI Station Positions", "Season of 1952," forwarded to Washington Office 12 January 1953.

G. SHORELINE AND TOPOGRAPHY

This is an off shore survey and no shoreline or topographic work was done.

H. SOUNDINGS

All soundings were taken with the previously mentioned fathometers. All soundings recorded on the fathograms were scanned and verified.

Due to the depth worked in no tide corrections were applied.

In accordance with the Director's letter, dated 21 June, 1951, 21/mek, S-1-P1, no velocity corrections were applied to the soundings.

I. CONTROL OF HYDROGRAPHY

The survey was controlled exclusively by EPI stations PAUL and SEGuam.

Weak control was encountered on the eastern portion of the sheet because the sounding lines were run between the two control stations where the arcs become tangent to one another. This made it necessary to adjust positions 6A to 1B, 6 to 12C, and positions 17 to 23C. This was done by plotting the appropriate arcs for each position to fix its location in a north-south direction and then, by using the individual logged distances, each position was fitted in so as to best agree with the total distance between reliable fixes. A total of 19 positions were adjusted in this manner.

J. ADEQUACY OF SURVEY

This survey is incomplete but that which has been done in the western half is considered adequate.

All junctions made with adjoining surveys are satisfactory.

K. CROSSLINES

Crosslines on this sheet will be run when the survey is completed. There is a total of eight crossings on the sheet, all of which are in close agreement.

L. COMPARISON WITH PRIOR SURVEYS

There are no prior surveys of this area.

M. COMPARISON WITH CHART

The largest scale chart available for comparison is C&GS chart 9302 (16th edition) July 1945. Due to the wide line spacing of this survey and the scarcity of soundings on the published chart no individual soundings could be compared.

U. MISCELLANEOUS

This is an offshore survey and there are no dangers to surface navigation, coast pilot information, aids to navigation, landmarks for charts, new geographic names, or silted areas to report within the limits of this survey.

This boat sheet was forwarded to the Washington Office for Photostating in the fall of 1952 and is being retained by this party for use during the 1953 field season.

V. DATA INCLUDED IN THIS REPORT

1. Abstract of EPI Corrections.
2. Abstract of Statistics.
3. Abstract and Computation of Arc Points.
4. Approval Sheet.

W. TABULATION OF APPLICABLE DATA

1. Special Report "Computation of EPI Corrections" to be submitted.
2. Special Report "Computation of EPI Station Positions" submitted, 1/12/53.
3. Notes from Seattle Processing Office regarding distortion of smooth sheet. Submitted with, but not in this report.

Respectfully submitted:

*Gerard E. Haraden*

Gerard E. Haraden  
Ensign, U.S.C. & G.S.

Approved and forwarded:

APPROVAL SHEET TO ACCOMPANY

Survey H-7951

(PI-503-52)

The field work was supervised closely and the boat sheet inspected daily.

The records and smooth sheet have been inspected and are approved.

The survey is incomplete but is believed to be adequate in the western portion. Additional lines should be run in the eastern part to develop the depth curves.

A handwritten signature in cursive script, appearing to read "Thos B Reed", with a long, sweeping flourish extending to the right.

Thos. B. Reed  
CAPT., USC&GS  
Com'd'g. Ship PIONEER

VERIFIER'S REPORT OF HYDROGRAPHIC SURVEY NO. H- 7951

Work for 1951 & 1952

The verifier should deal with the present hydrographic survey only, as the reviewer considers its relation to previous surveys and published charts. He should be thoroughly familiar with Chapters 3, 7 and 9 of the Hydrographic Manual.

1. The descriptive report was consulted and appropriate notes were made in soft pencil regarding action taken. ✓
2. Soundings originating with the survey and mentioned in the descriptive report have been verified, including latitude and longitude. ✓
3. All reference to survey sheets mentioned in the descriptive report include the registry number and year. ✓
4. Geographic names of hydrographic features if on sheet are in slanting lettering and of topographic features in vertical lettering. ✓
5. All items affecting the plotting of the survey which are entered in the remarks columns of the sounding records were noted and check marked. In all cases appropriate action was taken. ✓
6. All positions verified instrumentally were check marked in the sounding records. ✓
7. All critical soundings are clear and legible and are a little larger than the adjacent soundings. ✓
8. The metal protractor has been checked within the last three months. NA
9. The protracting and plotting of all bad crossings were verified. ✓
10. All detached positions locating critical soundings, rocks or buoys were verified. NA
11. The boat sheet was compared with the smooth sheet. NA

12. The spacing of soundings as recorded in the records was closely followed. ✓
13. The bottom characteristics were shown on outstanding shoals. ✓ NA
14. The reduction and plotting of doubtful soundings were checked. ✓
15. The transfer of contemporary topographic information was carefully examined. NA
16. All junctions were transferred and overlapping curves made identical. ✓
17. The notation "JOINS H- (1922)" was added in ink for all contemporary adjoining or overlapping sheets now registered. Those not verified are shown in pencil. ✓
18. The depth curves have been inspected before inking.
19. All triangulation stations and transfer of topographic and hydrographic signals were checked. NA
20. Heights of rocks were checked against range of tide. NA
21. Rocks transferred from topographic surveys have a dotted curve where shown thereon. Rocks located accurately by hydrographer are encircled by dotted red curve. NA
22. Unnecessary pencil notes have been removed. ✓
23. Objects on which signals are located and which fall outside of the low water line have been described on the sheet. NA
24. The low water line and delineation of shoal areas have been properly shown. NA
25. Degree and minutes values and symbols have been checked. ✓
26. Questionable soundings have been checked on the fathograms. ✓

27. Source of shoreline and signals (when not given in report). NA
28. All notes on sheet are in accordance with figure 171 in the Hydrographic Manual. ✓
29. All aids located, with those on contemporary topographic sheets, have been shown on survey. NA
30. Depth curves were satisfactory except as follows:
31. Sounding line crossings were satisfactory except as follows: ✓
32. Junctions with contemporary surveys were satisfactory except as follows: *See Verifiers Note to Reviewer.* ✓
33. Condition of sounding records was satisfactory except as follows: —
34. The protracting was satisfactory except as follows: ✓
35. The field plotting of soundings was satisfactory except as follows: —
36. Notes to reviewer: *See following note.*

Note to Reviewer  
Survey H-7951 (1971)

Item# 32

Depth curve agreement could not be verified in the area of the single hydro line Between Lat. 57°20' to 58°20' at Long 174°00' on H-8103 because the junctional soundings are not available at this office.

The depth curves on verified survey H-8103 should be changed to conform with the changes caused by additional hydrography of this survey.

Item 36.

No junctions were made with survey H-7949 to the southeast, H-7993 to the west or with H-7948 and H-8103 in the vicinity of St. Paul Island. The junctional surveys were not available to this office.

In the vicinity of St. Paul Island the following sounding lines were transferred to this survey by the field party from H-7949 and H-7950. The records for these positions were not available at this office. The unverified soundings were inked on the smooth sheet as per telcon with the Rockville office 16 July 72.

PROJECT CS - 343

1952

U. S. C. & G. S. S. PIONEER

THOS. B. REED - COMMANDING

Seattle, Wash.  
12 November 1958.

Memorandum to Commander Grinell concerning  
Bering Sea Sheet H 7591 Pf-Ex 40351,  
smooth sheet scale 1/ 500 000.

This sheet was returned from the Washington office.  
A small amount of work done in 1951 to locate the  
100 fathom curve was plotted upon it. No work was  
done on the sheet this year by the party of the  
PIONEER. The sheet has been completed by the  
PIONEER.

The Director's letter 325/MEK D-1-NW of 17 Oct. 1958  
implies that the sheet should be checked for  
distortion and accuracy.

Between the northern and southern parallels of the projection  
the sheet has stretched one millimeter. East and west  
directions hold true.

Thirteen first order GPSs were computed to check the  
EPI curves. With one exception, no distances greater than  
2 000 M/S were used in the computations. Where greater  
distances were used the azimuth was corrected at the  
2 000 M/S point and the line proceeded ahead the additional  
distance required using an azimuth 180 degrees from  
the back azimuth. The exception was a check point where  
a 3500 M/S distance was used on Az. 30°.

The plotted points fall exactly on the curves, except point H  
which misses the curve about 0.35 MI.

The sheet is considered to be in very good condition.

After consulting with Captain Pierce, as well as with  
Captain Heaton and yourself, the sheet is being forwarded  
to the PIONEER. The Director's letter and our computations  
will accompany it.

Edgar E. Smith

  
Capt. USN.  
Seattle Processing Office.

705 Federal Office Building  
Seattle 4, Washington

Subject: Smooth Sheet H-7951

Smooth sheet H-7951 (PF-40351) has been forwarded to you this date by registered mail for the addition of the 1952 field season's work on sheet PI-50352. If it is impracticable to make this addition due to distortion, the 1951 work shall be replotted on a new smooth sheet, thereby combining smooth sheets PF-40351 and PI-50352.

*Earl O. Heston*  
Acting Director.

cc. Ship PATHFINDER  
Ship PIONEER

*E.E. Smith:-*

*Suggest you carefully check projection on H-7951  
and discuss plotting of 1952 work with Capt. Pierce.*

Computations to Investigate curves on Sheet H 7951 PF-EX 40351 Bering Sea.  
Made in Seattle Proc. Off. by C.A.J.P. October 1952.

In addition to the points computed and used for verification, A,B,C...etc. which were sent to you, many other control points were used when the sheet was made. Those controlling EPI E curves pertinent to this discussion are lettered on the sheet as U,V,W,X,Y & Z. The computations for these points were not sent you. The only place where the curves are not satisfactory is at Point H. If any adjustment is to be made the line GH should be subdivided and the correction faired into the curves toward Y and Z.

This correction was not made here because Captain Pierce is of the impression that you have already made a new sheet. If you have not done so. I recommend that you use this sheet.

E.E.Smith 11/13/52

Handwritten signature of E.E. Smith, consisting of three stylized vertical strokes followed by a checkmark and a horizontal line.
