✓= Misc. items removed from the D.R. and filed in the cahier

A. PROJECT

This survey, MI-80-1-78 (H-9738), was conducted by the NOAA SHIP MT MITCHELL S222 as a portion of the Atlantic Seaboard Area Project (ASAP) OPR-D103 (516)-MI-78. "DELMARVANC" Phase, in accordance with Project Instructions dated 8 December 1977 and changes 1 through 5 dated 16 December 1977, 21 December 1977, 7 February 1978, 6 March 1978 and 9 March 1978, respectively.

B. AREA SURVEYED

This survey was conducted in the Atlantic Ocean Offshore between Cape Henry, Virginia and Currituck Beach, North Carolina, extending approximately from the 20 fathom curve to the 1300 fathom curve. Hydrographic surveying was used from the 20 to the 110 fathom curves with Bathymetric surveying from the 110 fathom curve to the limits of the survey. The limits of the survey are described by lines connecting the following points in a clockwise direction:

(1)	(2)	(3)	(4)	(5)	(6)
36°47'N 74°54'W	36°47'N 74°04'W	36°18'N 74°06'W	36°18'N 75°05'W	36°26'N 75°05'W	36°26'N 74°54'W

This survey was conducted between 9 February 1978 (JD 40) and 21 March 1978 (JD 80).

C. SOUNDING VESSEL

All soundings for this survey were obtained by the NOAA SHIP MT MITCHELL S222 (Vessel Number 2220 for all survey records) utilizing a fully automated hydroplot system.

D. SOUNDING EQUIPMENT AND CORRECTIONS TO ECHO SOUNDINGS

The following equipment was used to obtain soundings for this survey:

Equipment:	Serial No:
Ross Model 5000 Fineline Depth Recorder	1050
Ross Model 4000 Transceiver	1050
Ross Digitizer	1050
Raytheon Universal Graphic Recorder	170
EDO Model 248-1 Transceiver	219
Digitrak Model 261C Digitizer	202

Generally, in depths less than 200 fathoms soundings were obtained by the Ross Fineline Recorder using the Skeg Transducer (antenna distance 32.0 meters). In depths greater than 200 fathoms the Raytheon UGR was used on the Sound Room No. 2 transducer (antenna distance 0.0 meters) the Sound Room No. 1 transducer (antenna distance 0.0), and the skeg trans-

ducer (antenna distance 32.0 meters). The changes were noted in the sounding volume and on the abstract of antenna distances which is included in this report. The digitizing features of both units were used whenever possible; however, during periods of rough seas, the digitizer on the UGR would stop tracking the signal. During these periods soundings were scaled on line and entered manually on the hydroplot controller.

All graphic sounding records were scanned by trained Survey Department personnel and checked by the Officer in Charge. Peaks and deeps considered significant that occurred between soundings were inserted, digitizing errors were corrected, and the effects of the seas were meaned and corrected on the corrector tapes. Scale checks were made on the UGR to ensure proper digitizing. Phase calibration checks on the Ross Fathometer were made at frequent intervals to ensure scale accuracy. Any necessary adjustments were made and noted on the fathogram. Any departure of the trace from the calibration due to phase differences were corrected during the scanning process by survey personnel.

A 2.3 fathom draft correction was used on line and during smooth plotting. Draft changes and the effects of settlement and squat were very small for the depths of this survey and were entered as zero on the TC/TI tape. A printout of this tape accompanies the records along with a copy of settlement and squat versus engine RPM. These corrections were determined on 25 July 1977 on Lake Huron in St. Ignace, Michigan. Data plotted on the smooth field sheets only include the 2.3 fathom draft correction.

Velocity corrections were determined from the salinity and temperature data of four Nansen Casts taken at the following locations:

Station:	Date:	Latitude:	Longitude:
Z1	12 February 1978 (JD 43)	36°35.7'N	74°51.0'W
Z2	12 February 1978 (JD 43)	36°36.0'N	74°41.0'W
Z3	13 February 1978 (JD 44)	36°32.4'N	73°56.2'W
Z4	15 February 1978 (JD 46)	36°30.2'N	74°44.5'W

For depths less than 180 fathoms information from casts Z1, Z2, and Z4 were averaged because they were in good agreement. Data obtained from Z2 and Z3 for deep water were also in good agreement and so were averaged to determine corrections for depths greater that 180 fathoms. These corrections were combined on to one velocity corrector tape. A printout of this tape plus other tables and curves used in its production are included in this report.

This survey was conducted using predicted tides based on daily predictions at Hampton Roads (Sewells Point), Virginia from the 1978 tide tables. Prezoned tide correctors were supplied by the Rockville Tides Branch in change number 3 dated 7 February 1978. Tide correctors were applied to

on line data as follows: 3 hours and no minutes were subtracted from the high and low water times; the high and low water heights were multiplied by a factor of 1.18. A copy of the request for the actual tides in the area surveyed is included with this report.

On February 8, 1978 (JD 39) a vertical cast was taken for the Ross fathometer in calm seas off Little Creek, Virginia in Chesapeake Bay. Velocity corrections were determined from a Nansen Cast taken at the same time and place. The corrections from the vertical cast were small (about 0.2 fathom) for the survey depths and were considered to be zero.

E. HYDROGRAPHIC SHEETS

This survey was plotted on two complot roll plotter sheets by the NOAA SHIP MT MITCHELL Hydroplot System. The skew used was 0,21,60, for both sheets. The survey was plotted off line using an electronic corrector tape, a velocity corrector tape, and the master tape which was generated on line. Soundings on the field sheets are corrected for predicted tides, draft, initial and digitizing errors, and sound velocity. They are not corrected for settlement and squat and instrument error is negligible. The final smooth sheet will be plotted at the Atlantic Marine Center, Norfolk, Virginia. The following tapes will be forwarded with other records to the Atlantic Marine Center:

Master Range-Range Data Tapes
Electronic Corrector Tapes
Parameter Tapes
ASC II Signal Tape
Transducer Corrector/Table Indicating Tape
Velocity Correction Tape

F. CONTROL STATIONS

Control was obtained by 2 Hydrotrac shore stations at the following positions:

Signal No:	Name:	Latitude:	Longitude:
100	CERC #46 (Bodie Island)	35°50'42.753"N	75°33'48.578"W
200	GRAVITY (Sandbridge)	36°40'31.453"N	75°54'56.471"W

Both shore stations were located by personnel from the Atlantic Marine Center, Operations Division and were maintained by ship's personnel.

G. HYDROGRAPHIC POSITION CONTROL

An Odom Offshore Hydrotrac System, operating at a frequency of 1618.65 Khz in the Range-Range mode, provided the position control for this survey.

The following Hydrotrac equipment was used:

	Type:	Serial No:
Ship:	Master Drive Unit Model 700	122
	Receiver Model 700	328
	Coupler	135
	Interface	102
	Linear Amplifier 74-87	537
	Sawtooth Recorder	8502
Station 100:	Slave Drive Unit Model 701	216
	Linear Amplifier	539
	Coupler	131
	Sola Power Supply	752
Station 200:	Slave Drive Unit Model 701	214
	Linear Amplifier	536
	Coupler	133
	Sola Power Supply	754

Hydrotrac calibration was accomplished using three point sextant fixes and comparing observed Hydrotrac range values with computed values obtained from the Hydroplot Calibration Program RK 561. A check fix was also used on each calibration. Only those fixes with an inverse distance of less than 5.0 meters were used on these calibrations.

The calibration area was located 3 miles off Virginia Beach, Virginia. Calibrationfixes varied by less than 0.1 lane during the entire project. At the beginning of each trip the results of several calibration fixes were meaned and these corrections were applied to all positions during each trip. Several times visibility conditions precluded 3 point sextant fixes, and the lane count was established by comparing Hydrotrac values with ranges observed from 2 Del Norte Stations at the following locations:

Signal No:	Stations:	Latitude:	Longitude:	Ser.#:	Type:
210	Dolphin	36°49'55.972"N	75°58'13.745"W	1134	74
240	Cape Henry Lighthouse	36°55'34.335"N	76°00'27.216"W	220	72

Initially, the ships DMU Serial Number was 395 and the Master (Code 78) was Serial Number 1066. These were replaced on JD 55 at 1610 GMT due to water in the Master. The new units' Serial Numbers were DMU-190, Master (Code 76) - 185.

Each Master/DMU pair was calibrated against each remote over a measured

baseline on JD37 (February 6). In addition, the Del Norte system was calibrated using 3 point sextant fixes with a check angle. Correctors determined in this manner varied from -1 to +3 meters.

On JD 40 a buoy was deployed by the ship in order to check the whole lane count in the working area; however, upon return to the site on JD 47 the buoy was missing and therefore not used.

An abstract of all calibration data is included with the records accompanying the survey. The lane count was constantly monitored by trained Survey Department personnel by comparing the Hydrotrac readout with a running count on the sawtooth recorder. No lane jumps occurred while working on this survey. An abstract of the electronic correctors used is included with this report.

H. SHORELINE

There was no shoreline within the limits of this survey.

I. CROSSLINES

Crosslines were run at least 45° to the main scheme sounding lines. Crossline mileage was about 23.6% of the deep main scheme lines and 10% of the shoal main scheme lines. There was excellent agreement between crosslines and main scheme lines with only a small variation in areas of steep slope.

J. JUNCTIONS See Verifier's Report

This survey junctions excellently with H-9677 (MI-80-1-77) to the North and H-9739 (MI-80-2-78) to the south. Contours from this survey continue smoothly to both H-9677 and H-9739.

K. COMPARISON WITH PRIOR SURVEYS See Verifier's Report

Two prior surveys were conducted within the area of this survey H-1721 (1886) and H-5995 (1935). The shoaler depths of H-1721 (20-30 fathoms) agree fairly well with the present survey. However, most of the prior survey soundings from H-1721 deeper than 30 fathoms indicate depths greater than those of the present survey. Likewise, the soundings from H-5995 agree fairly well with this survey on the continental shelf but show discrepancies in the depths greater than 100 fathoms (again generally deeper than the present survey). The probable cause of these disagreements is the increased accuracy of the present electronic positioning equipment and sounding apparatus.

There was one presurvey review item in the survey area. Presurvey Review Item No. 7 is listed as a 17 fathom shoaling reported by the Greek Ship TETI N. at Latitude 36°24'N and Longitude 74°53.5'W. Source in Chart Letter 607 of 1970.

Sounding lines spaced 200 meters apart were used to investigate the area. No evidence of shoaling was found and it is recommended that it be taken from the chart. Concur

L. COMPARISON WITH THE CHART See Verifier's Report

Comparison was made with Chart Number 12200 (1:416,744 scale) 28th Edition (April 3, 1976). Most soundings were in fair agreement on the shelf, generally within 2 fathoms. One prominent discrepancy is a charted 22 fathoms at latitude 36°29.5'N and longitude 74°49.5'W. This survey with 400 meeter line spacing shows a depth of 41 fathoms with no indication of shoaling. In depths greater than 100 fathoms discrepancies ran from 5 to 100 fathoms. As previously mentioned the probable causes of these disagreements is the increased accuracy of the present positioning and sounding equipment. Disregard 22 fms

M. ADEQUACY OF THE SURVEY

This survey is complete and adequate to supersede all prior work for charting this area.

N. AIDS TO NAVIGATION

There were no aids to navigation within the limits of the survey.

O. STATISTICS

Linear Nautical Miles of Main Scheme Hydro	1774.5
Linear Nautical Miles of Crosslines	315.5
Linear Nautical Miles of Development	148.5
Total Linear Nautical Miles of Hydro	2238.5
Total Miscellaneous Miles	789.5
Total Miles	3028.0
Square Miles of Hydrography	1170.0
Total Number of Positions	1587.0
Nansen Casts	4
Bottom Smaples	20

P. MISCELLANEOUS

Some development lines were run in the bathymetric surveying area to better define bottom contours.

Q. RECOMMENDATIONS

None

R. AUTOMATED DATA PROCESSING

The following Hydroplot computer programs were used to complete the processing of the survey:

	Program Name:	Version Date:
RK 111	Range-Range Real Time	01-30-76
RK 201	Grid, Signal, and Lattice Plot	04-18-75
RK 211	Range-Range Non-Real Time Plot	01-15-76
PM 360	Electronic Tape Abstract	02-02-76
AM 500	Predicted Tide Generator	11-10-72
RK 530	Velocity Correction Computations	05-10-76
RK 561	H/R Geodetic Calibration	02-19-75
RK 602	Extended Line Oriented Edition	05-21-75

S. REFERENCE TO REPORTS

None

APPENDIX 2

FIELD TIDE NOTE

FIELD TIDE NOTE

Field tide reduction of soundings was based on predicted tides from Hampton Roads (Sewells Pt), Virginia and were interpolated by a PDP8/E computer utilizing AM 500. All times of both predicted and recorded tides are GMT.

Two Tide Gages were installed at two locations in the project area. Location and period of operation is as follows:

Site:	Location:	Period:
Chesapeake Light Tower (260-0000)	36°54.3'N 75°42.8'W	1976 to present
Duck Pier, (CERC), NC (865-1370)	36°10.8'N 75°45.2'W	January 23, 1978 to present

Chesapeake Light Tower

A bubbler gage was installed and began operation during 1976 field season. At the beginning of the 1978 field season, the gage was serviced, but no levels were run in accordance with verbal orders from Tides Branch, Rockville. The tide observer was contacted every 2 weeks and the gage reportedly worked well during the entire survey period.

Duck Pier (CERC), NC

An ADR gage was installed and began operation January 23, 1978. The staff was installed and leveled on January 23, 1978. The observer was contacted every two weeks and the gage reportedly operated well during the entire survey period.

The Sandbridge tide gage was not installed for this sheet as per verbal instructions from Tides Branch, Rockville.

U.S. DEPARTMENT OF COMMERCE
National Oceanic and Atmospheric Administration
NATIONAL OCEAN SURVEY
NOAA SHIP MT MITCHELL S222
439 West York Street
Norfolk, Virginia 23510

Date : March 21, 1978

Reply to Attn. of:

To : Director, National Ocean Survey (Attn: C331)

From : Harold L. Mills
for Commanding Officer, NOAA SHIP MT MITCHELL S222

Subject: Tidal Data For Survey H-9738

It is requested that verified hourly heights of tides (using Greenwich Mean Time) from the tide gages listed below be forwarded to the Processing Division (CAM 3), Atlantic Marine Center, Norfolk, Virginia 23510.

Gage:	Latitude:	Longitude:
Chesapeake Light Tower (260-0000)	36°54.3'N	75°42.8'W
Duck Pier, CERC, NC (865-1370)	36°10.8'N	75°45.2'W

It is requested that the time and height correctors for each gage be zoned as per Project Instructions for the area described within the following corner points:

(1)	(2)	(3)	(4)	(5)	(6)
36°47'N 74°54'W	36°47'N 74°38'W	36°18'N 74°48'W	36°18'N 75°05'W	36°25'N 75°05'W	36°25'N 74°54'W

This information is requested for the following periods:

February 9, 1978 (JD 40) - March 21, 1978 (JD 80).

APPENDIX 4

ABSTRACT OF CORRECTIONS TO ECHO SOUNDINGS

SETTLEMENT AND SQUAT

MT MITCHELL 1977 Field Season

The settlement and squat test for the MT MITCHELL (S222) was conducted July 25, 1977 on Lake Huron, approximately one-half mile off the Coast Guard pier at St. Ignace, Michigan, using a Zeiss Ni-2 Level (S/N 142936), positioned at the end of the pier. Wave height was one foot and the wind was from 000° at 14 knots. To determine possible water level changes during the test, the height of water on the lee side of the pier was measured before, during, and after the level sightings; no change was observed.

A temporary buoy with a scope of 1.05 was deployed in 105 feet of water one-half mile from the end of the pier, and a series of readings was taken starting and ending no more than a ship's length from the buoy at idle, half, and standard speeds as the ship passed the buoy. Two passes, one port and one starboard, were made perpendicular to the pier at each speed on headings of 240° and 060°, respectively. An initial reading was taken at the beginning of the test with the ship dead in the water alongside the buoy. A portable tide staff (graduated in tenths of feet) was positioned on the center of the fantail cargo hatch cover located amidships to allow a clear line of sight to the onshore observer. The displacement of the staff from the skeg transducer was approximately 3 feet aft. Since all hydrography in Lake Huron was to be recorded using this transducer, the settlement and squat correctors were only determined at one location.

A draft reading of 14.0 feet was taken before the test. The ship was carrying four launches - two Pacific Plastics launches in davits 3 and 4 and two Jensen launches in davits 5 and 6. Settlement and squat was run using both engines and various pitch and rpm combinations as determined from a speed curve established May 1977 offshore Cape Henry, Virginia. The ship carried a full load of fuel and no fuel was transferred during the test.

Included is an abstract of the data obtained, suggested correctors versus ship speed, the graph of ship speed versus settlement and squat correctors, the "C" shot determination of instrument error, and the ship's speed curve.

Respectfully Submitted,

Virginia E. Newell

January 22, 1979

1. Introduction

No unusual problems were encountered during verification. The red changes in the Descriptive Report were made by the verifier. The projection parameters have been revised and inserted in the Descriptive Report.

The correction for antenna distance has been applied where necessary.

2. Control and Shoreline

a. The control is adequately described in Sections F. and G. of the Descriptive Report.

b. There is no shoreline within the survey limits.

3. Hydrography

a. Depths at crossings are in good agreement.

b. The standard depth curves are adequately delineated.

c. The development of the bottom configuration and investigation of the least depths are considered adequate with the following exceptions:

(1) A reduction of line spacing in the area of latitude 36°24.0', longitude 74°40.0' would have been beneficial for better delineation of the bathymetric contours.

(2) Three charted depths, that disagree with the present survey as much as 166 fathoms, were not investigated (see Section 6).

4. Condition of Survey

The sounding records, field sheets and accompanying overlays, hydrographic records, and the Descriptive Report are adequate and conform to the requirements of the Hydrographic Manual.

5. Junctions

H-9677	(1977)	1:80,000	to the north
H-9739	(1978)	1:80,000	to the south

Adequate junctions were effected with the two above mentioned surveys. (See Q.C. Report-item 2)

No contemporary survey junctions with the present survey to the east or west; however, present depths are in general agreement with charted depths.

6. Comparison With Prior Surveys

a. H-1721	(1886)	1:200,000	
H-5995	(1935-37)	1:120,000	with Ad. Wk.

These most recent prior surveys, taken together, cover the area common to the present survey. Comparison between the above prior surveys H-5995 and the present survey ~~shows the prior surveys to be generally deeper.~~ reveals .... (See Q.C. Report-item 3)

The three most noticeable differences are:

Prior Survey	Depth	Location	H-9738 Depth
H-1721	191 fathoms	LAT 36°18.7' LONG 74°47.0'	112-113 ~~79~~ fathoms
H-5995	894 fathoms	LAT 36°31.6' LONG 74°28.5'	1060 fathoms
H-5995	1018 fathoms	LAT 36°44.0' LONG 74°24.2'	981 fathoms

~~These depths and other depths east of the 100 fathom curve are from 60 to 150 fathoms deeper.~~ Irregular bottom configuration, slope of the Continental Shelf, and improved equipment and accuracy of survey techniques are probable causes for the differences.

The present survey is adequate to supersede the prior surveys within the common area.

b. (See Q.C. Report - item 6)

7. Comparison With Chart #12200 (~~28~~ 29th Edition, April ~~3~~ 9, 197~~6~~ 7)

(See Q.C. Report - item 4)

a. Hydrography

The charted hydrography originates with previously discussed prior surveys and supplemented with depths that are believed to be taken from a U. S. Navy Survey.

The present survey is adequate to supersede the charted hydrography except for the following:

(1) Submerged wreck located at latitude 36°30.0', longitude 74°47.0' was not investigated and should be retained as charted.

(2) Submerged wreck located at latitude 36°43.8', longitude 74°45.0' was not investigated and should be retained as charted.

(3) Rep 17 fathoms reported by the Greek Ship TET1 N. at latitude 36°24.0', longitude 74°53.5'. This area was investigated and no evidence of shoaling was found. It is recommended that this feature be deleted from the chart.

b. Aids to Navigation

There are no aids to navigation within limits of the present survey.

8. Compliance With Instructions

The survey adequately complies with the Project Instructions.

9. Additional Field Work

This survey is considered to be a good basic survey and no additional work is recommended.

APPROVAL SHEET
FOR
SURVEY H-9738

A. All revisions and additions made on the smooth sheet during verification have been entered in the magnetic tape records for this survey. A new final position printout has/~~has not~~ been made. A new final sounding printout has/~~has not~~ been made.

B. The verified smooth sheet has been inspected, is complete, and meets the requirements of the Hydrographic Manual. Exceptions are listed in the Verifier's Report.

OA/C352:KWW

March 16, 1979

TO: A. J. Patrick
Chief, Hydrographic Surveys Division

THRU: Chief, Quality Control Branch

FROM: K. W. Wellman
Quality Evaluator

SUBJECT: Quality Control Report for H-9738 (1978), Virginia and North Carolina, Off False Cape, Cape Henry to Currituck Beach

A quality control inspection of H-9738 was accomplished to monitor the survey for obvious deficiencies with respect to data acquisition, delineation of the bottom, determination of least depths and navigation hazards, junctions, decisions and actions by the verifier, and cartographic presentation of data.

In general, the present survey was found to conform to National Ocean Survey standards and requirements except as discussed in the Verifier's Report, the HIT Report, and as follows:

1. During verification, some depth curves were distorted in a manner inconsistent with the most likely natural bottom configuration. Such unnatural deviations of the depth curves should be avoided during the processing of future surveys.

2. Reference section 5 of the Verifier's Report:

The junction between the present survey and H-9677 (1977) on the north was not completed during verification as implied in the Verifier's Report. During quality control inspection, it was necessary to reconcile some of the depth curves within the common area and to ink the junctional note on H-9677. Such necessary additional work should have been discussed in the referenced section of the Verifier's Report. (See the memorandum dated March 21, 1977, from the Office of Marine Surveys and Maps entitled "Verifier's Report Format.")

3. Section 6-a of the Verifier's Report is supplemented by the following:

. . . reveals good general agreement of depths; i.e., within $\pm$ 1 fathom; in general depths less than 100 fathoms. Comparison with the sparse

development on the survey of 1886, however, reveals depth differences of as much as ± 10 fathoms in depths less than 100 fathoms. In general depths exceeding 100 fathoms, depth differences were noted to range to as much as ± 166 fathoms.

4. Reference section L of the Descriptive Report and section 7 of the Verifier's Report:

During field work and verification, the survey was compared with an obsolete edition of chart 12200. This is in contravention of the requirement that the survey be compared with ". . . the latest edition . . ." of the chart current at the time of the survey. (See sections 5.3.4(L) and 6.3.10 of the Hydrographic Manual.) During verification, the 29th Edition of chart 12200 (April 9, 1977) should have been used rather than the 28th Edition. During quality control inspection, it was determined that the 29th Edition of the chart had not been revised within the area covered by the present survey. Accordingly, the referenced section of the Verifier's Report has been revised to indicate that the 29th Edition of chart 12200 was considered and superseded within the common area.

5. The formal Tide Approval Note was not included in the Descriptive Report during verification. It was therefore necessary to request the approval note during quality control inspection. (See section 6.6(5) of the Hydrographic Manual--Fourth Edition.)

6. A comparison between the present survey and F.E. No. 17 (1957) W.D. was not accomplished during verification. Such a comparison was effected during the quality control inspection of the present survey.

Section 6 of the Verifier's Report is supplemented by the following:

b. F.E. No. 17 (1957) W.D. 1:40,000

The development on this F.E. covers a portion of the southwest corner of the present survey area. There are no conflicts between present depths and cleared effective depths within the common area.
