A. PROJECT

This hydrographic survey was conducted in accordance with Project Instructions OPR-L123-RA-78, San Francisco Bay, California, dated August 10, 1978; Change No. 1, Supplement to Instructions, dated August 21, 1978; and Change No. 2, Amendment to Instructions, dated August 28, 1978.

B. AREA SURVEYED

The portion of San Francisco Bay which was surveyed during OPR-L123-RA-78 was bounded on the north by  $37^{\circ}53'48''$  N, and  $37^{\circ}48'06''$  N on the south. The western and eastern boundaries are  $122^{\circ}26'00''$  and  $122^{\circ}21'00''$  respectively. The area includes Alcatraz Island, Treasure Island, and most of Angel Island. The area was surveyed at a scale of 1:10,000. Hydrographic survey operations began on 6 October 1978 (JD 231) and were completed on 22 November 1978 (JD 323).

C. SOUNDING VESSELS

The RAINIER's aluminum launches RA-3 (2123, Hull 1007) and RA-6 (2126, Hull 1013) were used to conduct the hydrographic survey. Each launch utilized sounding equipment whose respective serial numbers are found in Section D, "Sounding Equipment".

The RAINIER's Launch RA-5 (2125, Hull 1003) was used to obtain bottom samples during the last part of the survey.

D. SOUNDING EQUIPMENT

For RA-10-3-78, all echo soundings were obtained using Ross Fineline Fathometer Systems which include the following components: Ross Model 4000 Transceiver, Ross Model 5000 Analog Recorder, Ross Model 6000 Digitizer and 100 KHz transducer. The following table summarizes the serial number of the various components used in each vessel:

Component	RA-3 (2123)	RA-5 (2125)	RA-6 (2126)
Transceiver	1080	1040	1042
Analog Recorder	1071	1040	1042, 1070
Digitizer	1080	1040	1041-4

The survey was conducted in units of feet. For information detailing the procedures to obtain Corrections to Echo Soundings, refer to Echo Sounding Report, OPR-L123-RA-78.

#### E. HYDROGRAPHIC SHEETS

Hydrographic field sheets (including smooth field sheets) were compiled using the PDP8/e HYDROPLOT systems on the RAINIER (EDP Number 2120). The following table represents the serial numbers of the various components used for compilation of field sheets.

	S/N RAINIER (2120)
PDP 8/e Digital Computers	01015, 11430
DEC High Speed Readers	15150, 06400
Houston Complot Plotters	5848-18, 6166-23
Teletype Corp. ASR-33, Teletypes	567924, 321393

A modified transverse mercator projection was used for plotting of hydrographic data. A list of parameters used to define the projection is attached as a separate report.

Soundings plotted on RAINIER's smooth sheets have been corrected for predicted tides, launch draft, and preliminary velocity corrections. No discernable distortion of mylar sheets was observed during smooth field plotting of hydrographic data.

Two hydrographic sheets were used to cover the survey area, RA-10-3A-78 and RA-10-3B-78. Two 1:10,000 scale smooth sounding plots and two 1:10,000 scale position plots were submitted with the field data. Also submitted were 6 expansion sheets covering areas of closely spaced developments; 4 at 1:2500 scale on sheet 3A, 1 at 1:2500 scale on sheet 3B, and 1 at 1:5000 scale on sheet 3B. All data and accompanying field records were transferred to Pacific Marine Center, Seattle, Washington, for verification. Expansion sheets not forwarded, no longer available.

#### F. CONTROL STATIONS

Three Raydist stations were established in this survey: Angel Island, Treasure Island, and Brooks Island. Angel Island Peak 3, 1956, is an existing Triangulation Station. The station on Treasure Island was positioned by intersection using third order Class I procedures and described as "ALLEY 1978". Brooks Island Raydist station was set up eccentric on range between Triangulation Station BROOKS ISLAND 2, 1905, and RM No. 2.

In addition, several fixed aids to navigation were located by Third-Order methods and used for Mini-Ranger calibration and as visual signals during digital sextant hydrography.

Refer to Horizontal Control Report OPR-L123-RA-78 for details on these stations and all other triangulation stations established for survey support.

#### G. HYDROGRAPHIC POSITION CONTROL

Sounding line position control during this survey was provided by either range-range (Raydist), visual methods, or dead reckoning. Range-range methods were utilized wherever possible while Digital sextant methods (positions being determined by three-point sextant fixes) were restricted to areas where adequate Raydist control could not be established.

Position control on detached positions was provided by one of the above methods or by three-point sextant fixes (manual sextants).

At no time, while using either range-range (Raydist) or visual control, were weak geometric configurations encountered or unusual atmospheric conditions experienced that might have degraded the positional accuracy of the soundings taken during the survey.

Dead reckoning methods were utilized in confined areas where the launch could be accurately located by reference to shoreline features. Distances and directions to reference features were accurately noted on a boat sheet or diagrams of the area, while data was being collected. Three-point visual fixes were scaled as soon after data was collected as possible to permit automated data processing. Dead reckoning methods were restricted to the piers along the San Francisco waterfront where visual signals could not be seen and Raydist signals could not be received.

Three RAINIER launches, RA-3 (Electronic Data Processing Number 2123), RA-5 (EDP No. 2125), and RA-6 (EDP No. 2126) were used during the survey. Positioning equipment used aboard the three launches was as follows:

#### RAYDIST EQUIPMENT

Vessel No.	Raydist Transmitter	Raydist Navigator	Raydist Position Indicator	Hazlow Navigation Interface
2123	170	117	120	3
2125	166	114	117	17
2126	167	115	118	35

#### DIGITAL SEXTANT EQUIPMENT

Vessel No.	Left Digital Sextant	Right Digital Sextant	Hazlow Navigation Interface
2123	TG-0322	TG-0321	3
2126	TU-3601	TU-3600	35

Three Raydist shore stations, Station ANGEL ISLAND PEAK 3 1956, Signal 105, Station ALLEY 1978, Signal 106, and Station BROOKS ISLAND ECC. 1978, Signal 112, were established and used for controlling hydrography on sheet H-9794. Station ANGEL ISLAND PEAK 3 1956 was equipped with Red Raydist transmitter S/N 232; Station ALLEY 1978 was equipped with Green Raydist transmitter S/N 233; while Station BROOKS ISLAND ECC. 1978 was equipped with Red Raydist transmitter S/N 242. For a detailed discussion of the three Raydist shore stations see Electronic Control Report OPR-L123-RA-78.

Raydist equipment calibrations were performed at least twice daily except when obviated by equipment failures. The following two methods of calibrating were used.

Static: The vessel was positioned alongside a station of known geodetic location, then predetermined lane counts entered into the navigation system. At least three readings were then made to obtain sufficient data to calculate a mean corrector to the partial (fractional) lane count. All sets of data for any single day were meant to obtain the correctors used in plotting of survey data.

Visual: Calibrations were accomplished by means of three-point sextant fixes with check angle using PDP 8/e software RF 561 for processing and determining lane counts.

When digital sextants were used for hydrography the index correction on both digital sextants in a pair was checked frequently and noted on the Raw Data Printout. The index correction was checked by zeroing both sextants in the pair and annotating the digital readouts in half minutes. This was done at the beginning of each day, at the end of each series of lines and whenever there was a change in angleman. Whenever an error of more than 1.5 minutes was noted, the sextants were rezeroed.

A daily breakdown of vessels used, type of control used, and explanatory remarks concerning control is ~~on the following pages.~~ filed with field records.

#### H. SHORELINE

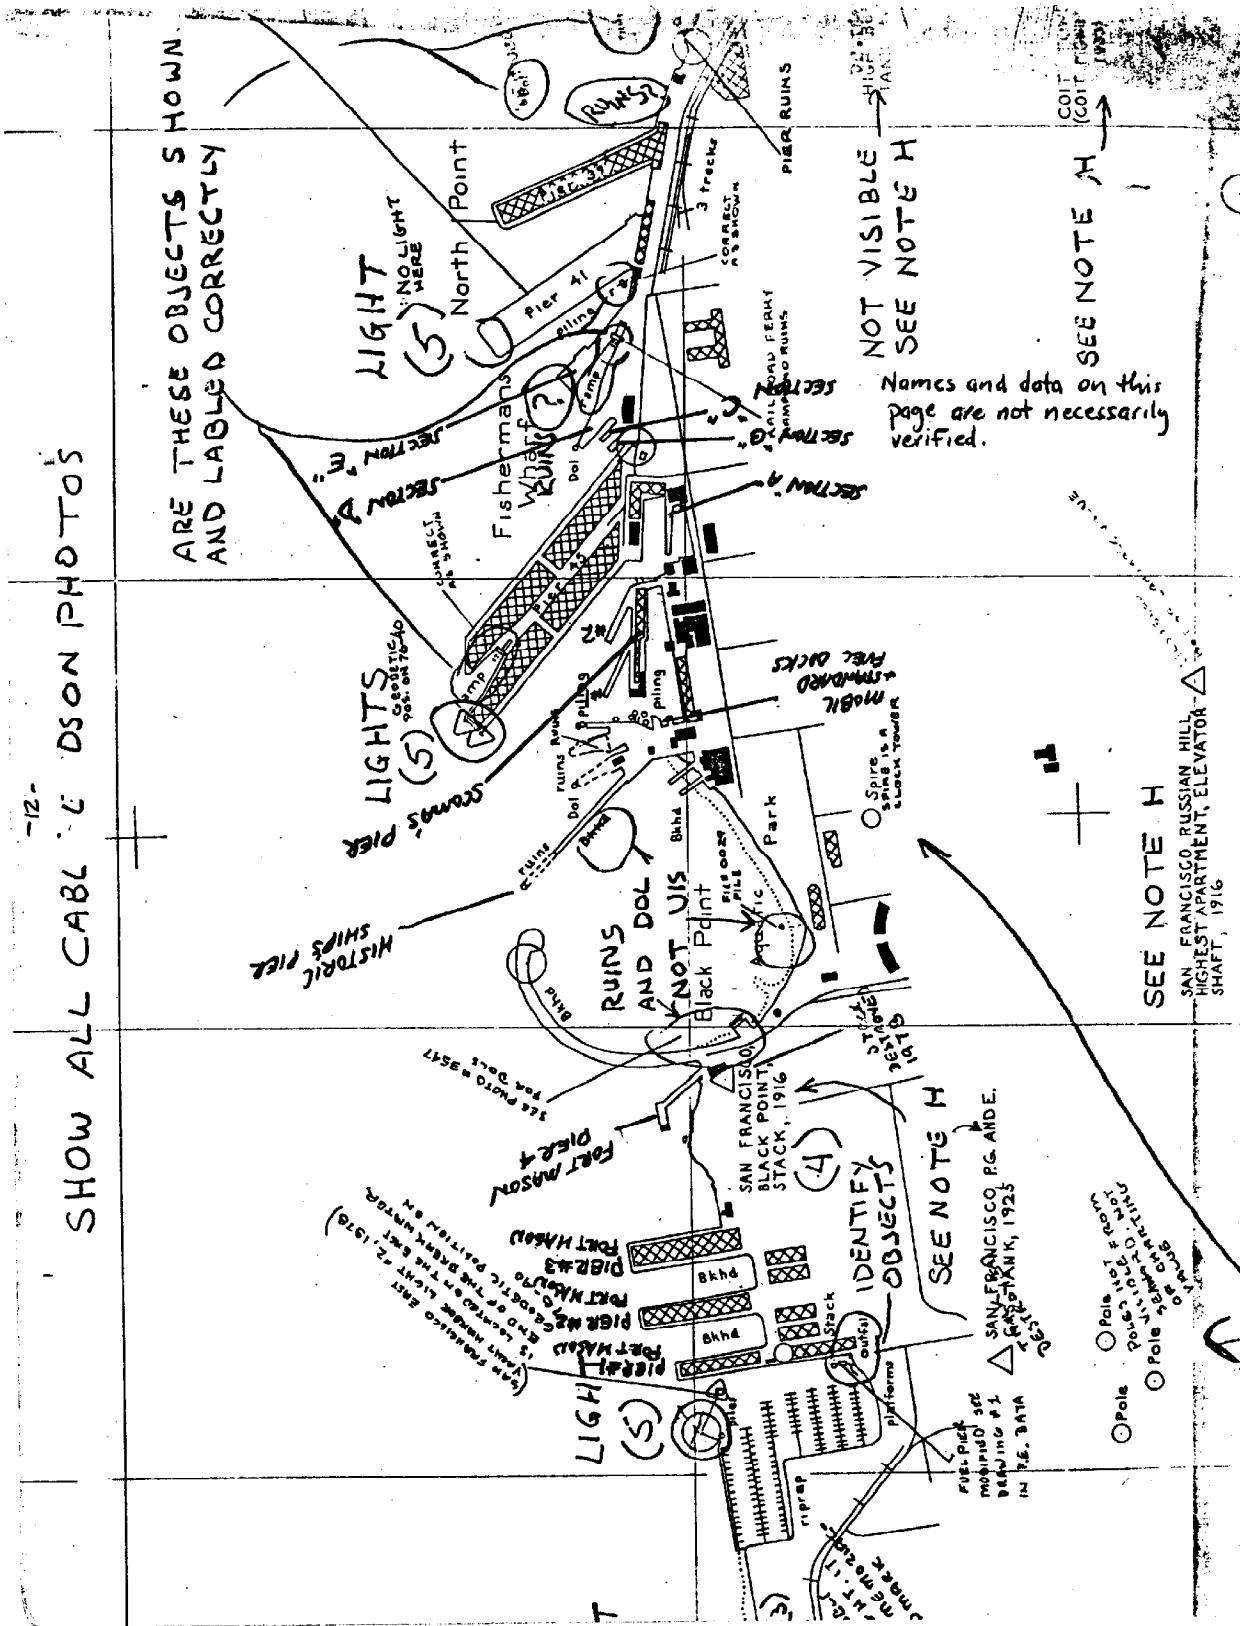

Shoreline for H-9794 was transferred from unedited Class III shoreline manuscripts TP-00526, TP-00528, and TP-00529. These shoreline manuscripts were field edited during the course of the survey and include all areas covered by field sheet H-9794. Changes and corrections noted during field edit were not transferred to the field sheet. Contact was maintained between the field editor and the hydrographer to prevent duplication of fix information. TP-00527 was field edited in 1979.

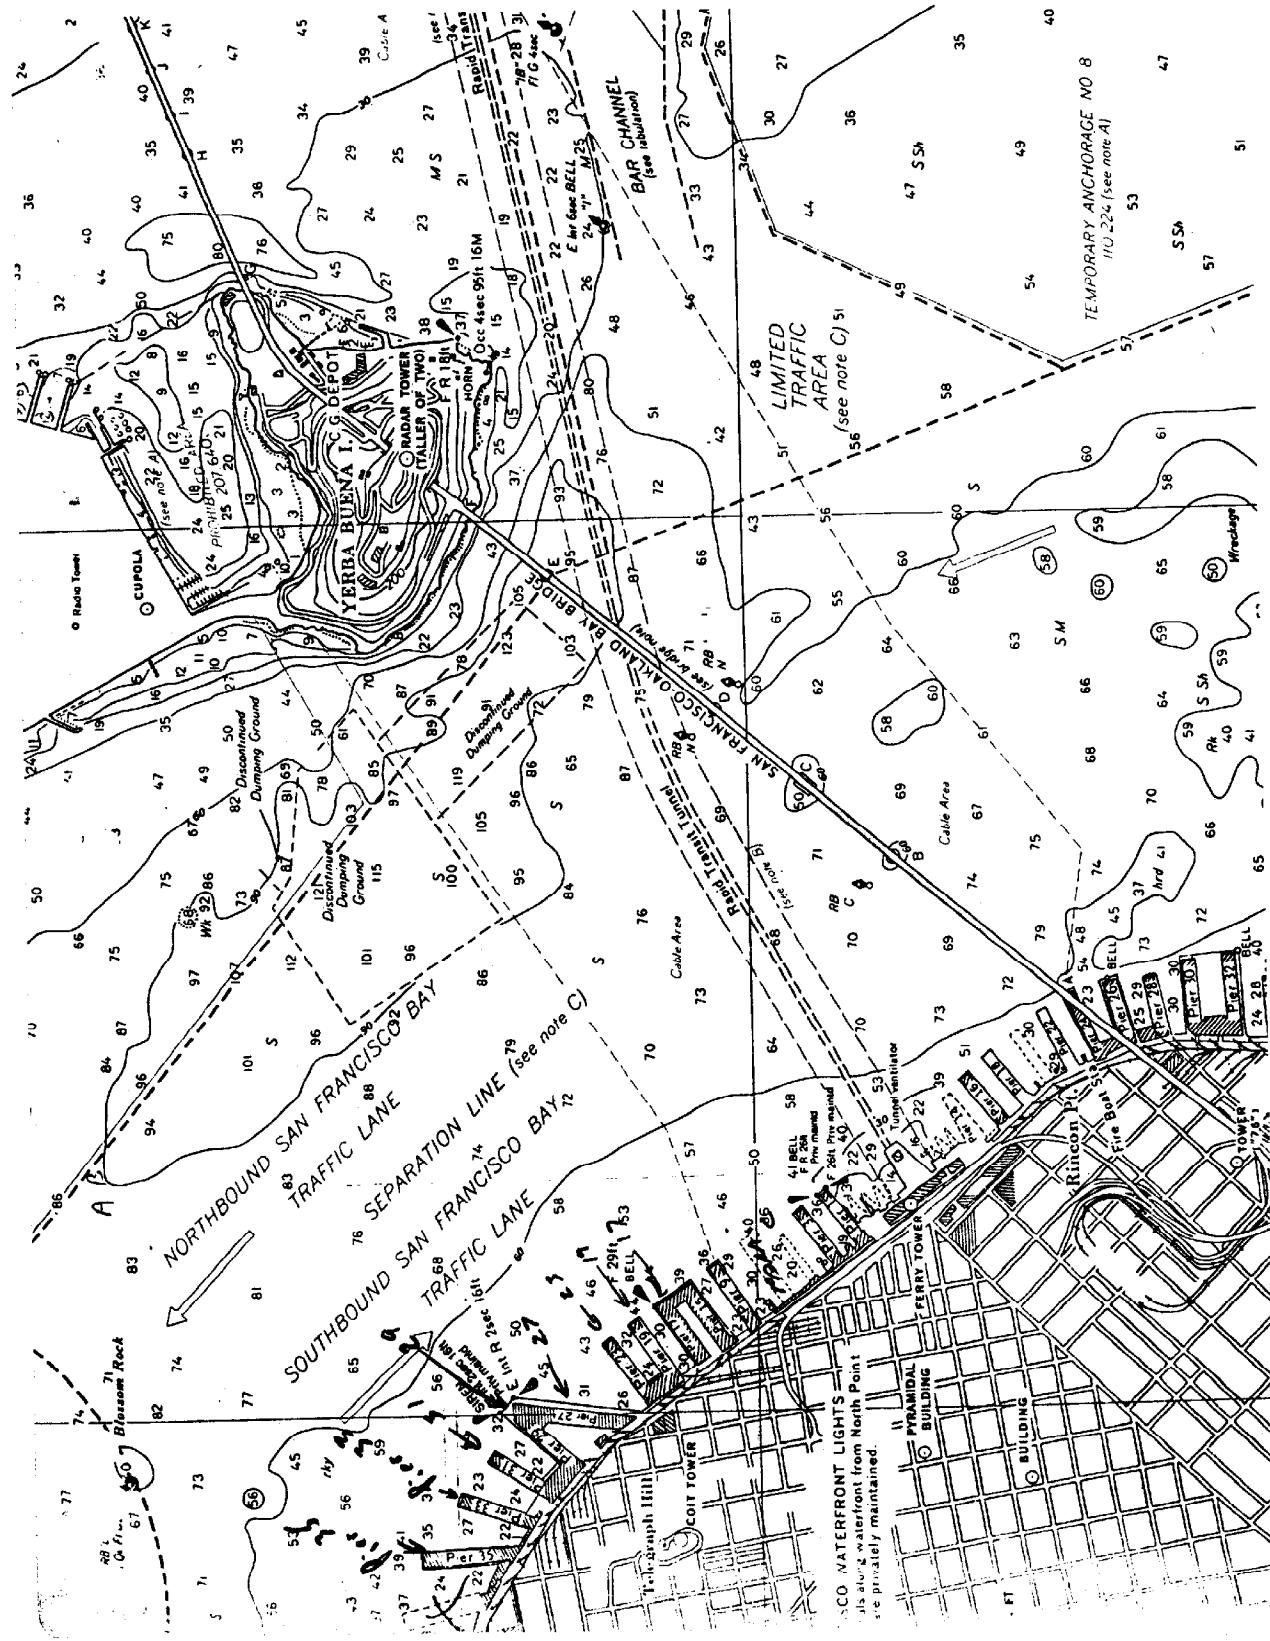

See ER  
Sect 2

SHOW ALL CABLES ON PHOTOS

12

ARE THESE OBJECTS SHOWN AND LABELED CORRECTLY

Walking hydrography was done along all the pier faces and bulkheads extending east from Fort Mason Pier #1. The soundings were taken with a lead line and spaced at 20 to 30 meters. There is a good comparison between these soundings and those taken from the hydro launch 15 meters off the piers. A sounding volume with the raw data has been submitted. A summary of the average depths in feet along each pier face and a diagram of piers follows:

	AVERAGE DEPTH*	Chart compiler note this

#### I. CROSSLINES

Crosslines for the survey totaled 65.1 nautical miles or 13% of the main scheme sounding lines. With the exception of the shore lines, all crosslines were run normal to the main scheme lines. A comparison of crossline and main scheme soundings was conducted over only those soundings found to be touching one another. It was felt that a comparison of those soundings not touching would be meaningless due to positioning differences, and interpolation of depth values in even a regular bottom would be stretching the credibility of the comparison. Soundings in areas of greater relief differed the most, but, in general, agreement between crosslines and main scheme soundings was excellent. A summary of 579 depth comparisons is as follows:

DEPTHS	<u>Exact</u>	AGREEMENT			
		<u>1 ft</u>	<u>2 ft</u>	<u>3 ft</u>	<u>3-6 ft</u>
0-30 ft.	185	110	2	2	1
31-60 ft.	44	56	13	2	0
61-90 ft.	34	38	17	1	3
91-120 ft.	16	15	9	1	3
120 ft.	15	9	2	1	0

(maximum depth = 155 ft.)

Depths at crossline-main scheme intersections; agree exactly at 51% of intersections, differ by 1 foot or less 90% of intersections, differ by 2 feet or less 98% of intersections, and 99% of all intersections differ by 3 feet or less. All crosslines were smooth plotted in red ink. ✓

#### J. JUNCTIONS

H-9794 (RA-10-3-78) was a survey comprised of two boatsheets, "A" and "B". The junction between the boatsheets is a line running north-south along longitude 122°23.5'W from the southern to the northern survey boundary. There was no overlap at this junction because the same launch, fathometer, and Raydist control were used in running the junction lines. A check of the depth curves between the two junctioning sheets shows the continuity to be excellent. ✓

H-9794 does not junction with any contemporary surveys. It does junction with H-9793 (RA-10-2B-78) along the western most boundary, 122°26.0'W. This junctioning line is broken up into two parts by Angel Island. South of Angel Island there were no overlapping lines run. The same Raydist control, launch and fathometer were used to run the lines where the two sheets junction. The continuity of the depth curves was checked and found to be excellent. SEE ER Sect 5

From the north shore of Angel Island to the northern boundary of the survey, overlapping occurs between the Raydist control used on Sheet "3A" and the visual control used on Sheet "2B". A comparison of 29 soundings between 50 and 100 feet yielded the following:

- 28% agreed exactly
- 31% agreed to within 1 ft.
- 20% agreed to within 2 ft.
- 11% agreed to within 3 ft.
- 10% agreed to within 5 ft.

Only a few of these soundings were exactly on top of the other; therefore, the larger discrepancies can be attributed to positioning differences. The maximum difference found was 5 feet. Also sand ridge rise to 12 ft with isolated differences of 8-15 feet. See E.R., Sect 3.

#### K. COMPARISON WITH PRIOR SURVEYS

Following is a discussion of each presurvey review item falling within the limits of survey H-9794, including a description of the item, the

K. COMPARISON WITH PRIOR SURVEYS

Following is a discussion of each presurvey review item falling within the limits of survey H-9794, including a description of the item, the method of investigation, the results, and a charting recommendation.

PSR Item #8

Description: A dangerous sunken wreck, charted at latitude  $37^{\circ}52'09''$ , longitude  $122^{\circ}25'11''$ , originated with a U. S. Navy survey of 1952 (Bp-49005) and is described only as a derelict.

The wreck should be searched for in the vicinity of the charted position. No further investigation will be required if strong evidence of the wreck is found utilizing an echo sounder. However, should corrected least depth of 51 feet or less be obtained, then the hydrographer should ensure that no lesser depths exist. Standard wreck sounding techniques described in the Hydrographic Manual or diver investigation should be employed.

Method of Investigation: Launch hydrographic development.

Results: A hydrographic development using 10 meter spacing was run in the vicinity of the charted position and soundings of 55 feet were recorded. No further investigation was performed. It is recommended that the wreck remain as described on the chart. ~~For further details, refer to RA 10 3A 78, Expansion #4, 1:2500 scale. Concur. \*SIGT2~~  
~~A least depth has not been determined.~~

PSR Item #12

Description: Submerged pier ruins, charted in the vicinity of latitude  $37^{\circ}48'35''$ , longitude  $122^{\circ}24'27''$ , were reported by a USCG Auxiliary observer in 1975 and described to be the remains of a pier destroyed by fire (CL 1905/75). The hydrographer should determine if the ruins, as charted, continue to exist. Any indication that the area is foul will be cause to discontinue further investigation and report that ruins remain.

Method of Investigation: No investigation needed.

Results: The remains of Pier 37 (pilings) were all removed and a yacht marina was built over the former location. The marina is an extension of the new complex built on Pier 39 including a floating breakwater. See ER Sect 6  
in front of the marina. For details on this new construction see field edit sheet TP-00528.

PSR Item #25

Description: The 44-foot sounding, charted at latitude  $37^{\circ}49'44''$ , longitude  $122^{\circ}24'45''$ , originated with a U. S. Corps of Engineers survey in 1977 and was subsequently reported in LNM 21/77. The area northeast of Alcatraz Island is reported to be shoaling to depths less than 50 feet. The extent of the shoaling should be ascertained.

Method of Investigation: Hydrographic development, 10 meter spacing. SEE ER

Results: The above mentioned position was investigated with 10 meter spacing and a 43 foot shoal was discovered. Four other hydrographic developments were performed to the northeast of Alcatraz Island and three 48 foot shoals and one 51 foot shoal were discovered. It is recommended that this survey be used to supercede all prior surveys in this area. ~~For details on these developments see RA-10-3A-78, Expansion #1, 1:2500 scale.~~

PSR Item #26

(piles originate from H-7706 (1949), described as dolphins)

Description: The submerged piles, charted in the vicinity of latitude  $37^{\circ}48'33''$ , longitude  $122^{\circ}25'17''$ , originated from a report by a USCG Auxiliary member that the charted piles were removed (CL 258/78). (Aquatic Park) Further information relative to the removal of the piles may be obtained from the above observer. Should the hydrographer determine that the information is sufficient to recommend removal of the piles from the chart, it should be so stated. An attempt to verify or disprove the piles through an onsite search will require the use of a wire sweep. ✓

Method of Investigation: Diver investigation.

Results: A thorough investigation of the area was made using a 50 meter line between 3 divers. No obstructions of any kind were encountered. Therefore it is recommended that these "submerged piles" be removed from the chart. For further details and position data, refer to ~~Dive Investigation Report, OPR-L123-RA-78. Filed in OA/C5131~~

There are seven prior surveys that lie within the limits of H-9794. They are H-7619 (1947, 1:10,000), H-7620 (1947, 1:10,000), H-7621 (1947, 1:10,000), H-7622 (1947, 1:5,000), H-7704 (1948, 1:10,000), H-7705 (1948, 1:10,000) and H-7706 (1948, 1:5,000), H-7716 (1948, 1:5,000)

A comparison with H-7619 yielded the following results:

- 14 (33%) agreed exactly
- 18 (42%) agreed to within 1 foot
- 8 (19%) agreed to within 3 feet
- 3 (6%) agreed to within 6 feet

SEE ER  
Sect 6

H-7619 covers the area east of Angel Island and ~~north of Treasure~~  
Island. From a total sample of 43, 75% of the soundings agreed to  
within 1 foot.

A comparison with H-7620 resulted in the following:

- 7 (50%) agreed exactly
- 2 (14%) agreed to within 2 feet
- 3 (22%) agreed to within 3 feet
- 2 (14%) agreed to within 6 feet

SEE ER  
Sect 6

H-7620 covers the area north-northeast of Angel Island. This compari-  
son was taken from a small sample of soundings (14) but shows good  
overall agreement with H-9794.

The following shows the results of a general comparison with H-7621:

- 10 (40%) agreed exactly
- 4 (16%) agreed to within 1 foot
- 4 (16%) agreed to within 3 feet
- 2 (8%) agreed to within 5 feet
- 5 (20%) differed by more than 8 feet

SEE ER  
Sect 6

H-7621 covers an area south of Angel Island to the north shore of  
San Francisco. There are 5 soundings in the comparison which differed  
greatly from H-9794. When overlapping the two sheets it was apparent <sup>50' located</sup> in areas  
that the area south of Alcatraz Island ~~shoaling~~ has occurred. In <sup>←</sup> some areas where the depths were 160 feet in 1947, soundings of 85 feet  
were recorded on H-9794. This shoaling action is apparent throughout SEE  
the bay because of strong tidal currents acting on sandy silty bottoms. ER  
The sediment transport is proven by the 0-2 foot visibility found Sect 7a  
in the bay. The RAINIER recommends that these shoaler areas be charted  
in accordance with this survey's data. \* area of discont<sup>inued</sup> dumping ground

H-7622 consists of the shoreline soundings off Treasure Island and  
Yerba Buena Island. Since there is a difference in scale, a compari-  
son was made between H-9794 and nine hand plotted fixes from H-7622.  
Eight of nine soundings agreed within 3 feet but one sounding differed  
by 8 feet. When comparing the two sheets, it was found that shoaling  
had occurred in the cove between Treasure Island and Yerba Buena  
Island. The average depth in 1947 was 30 feet. Now it has an average  
depth of 20 feet.

SEE  
ER  
Sect 6

The following is a general comparison of prior survey H-7704:

- 5 (42%) agreed exactly
- 3 (25%) agreed to within 1 foot
- 3 (25%) agreed to within 3 feet
- 1 (8%) agreed to within 5 feet

SEE ER  
Sect 6

This sample of 12 soundings was taken from hand plotted fixes from H-7704. It shows very good agreement overall but there were two areas of shoaling just south of Angel Island that were developed using 10 meter spacing. In both cases the shoaling agreed to within 1 foot of the prior survey; therefore, both shoals should remain as they are charted. ~~For details refer to RA 10-3A-78, Expansion #3, 1:2500 scale.~~

A comparison of H-7705 yielded the following results:

- 12 (43%) agreed exactly
- 10 (36%) agreed within 1 foot
- 5 (18%) agreed within 2 feet
- 1 (3%) agreed within 4 feet

SEE ER  
Sect 6

H-7705 covers an area from the east side of Angel Island northeast to Brooks Island. 97% of these soundings were within 2 feet of those on H-9794. No significant changes occurred in this area.

H-7706 covers a small area along north San Francisco's waterfront. Only 5 soundings were transferred to the 1:10,000 scale; 4 agreed exactly and 1 was 4 feet deeper than the prior survey. Overall the SEE ER depths showed excellent agreement between the two surveys. Sect 6

In general, comparisons of prior and present surveys were very good. One can attribute any small differences to the following: date and methods used in early surveys for positioning of soundings, inferior sounding methods, errors in transferring sounding positions from prior survey to present survey sheets, and from actual changes to the bottom due to erosion and deposition. In the area south of Alcatraz Island where ~~shoaling~~ <sup>x area of</sup> has occurred, there exists very strong tidal currents that are capable of moving and depositing the ~~discontinued~~ <sup>dumping</sup> soft silty sand that exists in the bay. The 0-2 foot visibility <sup>ground</sup> that is found in the bay demonstrates the amount of sediment carried in the water. In areas where significant scouring has occurred in the ~~See ER~~ last 30 years, a considerable amount of development hydrography, at <sup>Sect 7a</sup> 10 meter spacing, was run in order to disprove shoaler prior survey soundings, to prevent their being carried forward onto the present survey, and to eventually effect their removal from the chart. It was not feasible, however, to so thoroughly develop all scoured areas. In those less developed areas the general deepening trend shown by the present mainscheme hydrography is considered sufficient to discredit the shoaler prior survey soundings, and these obsolete lesser depths should not be carried forward.

#### L. COMPARISON WITH THE CHART

The survey area is found on two charts--No. 18650, 34th edition, May 20, 1978 (1:20,000) and No. 18649, 45th edition, February 4, 1978 (1:40,000). No. 18650, the larger scale chart, covers all areas south of latitude 37°51.3'N; therefore, all areas north of this latitude must be compared to the small scale chart, No. 18649. ✓

~~In order to compare the RAINIER's soundings to Chart No. 18650, see~~

In order to compare the RAINIER's soundings to Chart No. 18650, an enlargement (1:10,000 scale) was used. Destroyed.

The comparison of the area south of Alcatraz Island is good. The depth curves and soundings are all good except just off the southern most tip of Alcatraz Island. The RAINIER's survey shows a 26 foot shoal where the chart shows a 60 foot curve. This occurs on a steep slope and could be an error in positioning between the survey and chart. A number of hydrographic developments were run around Alcatraz Island to investigate 40 foot shoals noted on Chart 18650. This survey produced a 46 foot shoal where the previous 40 foot shoal existed, approx. (37°49.7'N, 122°25.1'W). Strong currents carrying sediment cause a scouring effect around Alcatraz Island; therefore, the RAINIER recommends that these shoals be charted at 46 feet, ~~for more detailed information see RA 10-3A-78, Expansion #1, using present survey information. Refer also to E.R. Sect 7a PSR Item 25~~. ✓

The soundings and depth curves north of Alcatraz Island to Angel Island compare very good. It should be noted that strong tide rips were experienced just off the southeast tip of Angel Island (Pt. Blunt). The charted wreck northeast of Angel Island was discussed in Section K, Presurvey Review Item #8.

Two degaussing ranges charted at 37°51.3'N, 122°24.7'W, and 37°52.8'N, 122°24.1'W are deactivated and have not been used for approximately 15 years. The degaussing range charted at 37°49.0'N, 122°26.2'W is presently in an inactive status and has not been used for approximately 5-6 years. It is scheduled to be deactivated in February 1979 by the United States Navy. The RAINIER recommends that all three degaussing ranges be removed from the chart. For information regarding degaussing ranges, contact Mr. Donald Blair, Technical Director, Degaussing Facility Naval Station, San Diego, California (714-225-6631).

The area north and northeast of Angel Island can only be compared to Chart No. 18649 which is a 1:40,000 scale chart. This area was a very consistent gradual change in topography. Consequently the depth curve comparisons are excellent in this area. "Area of sand waves" added to smooth sheet. ✓

The area from Brooks Island south to Treasure Island is very shallow and has a consistent bottom topography. The soundings in this area of the survey are excellent in comparison with Chart No. 18649. ✓

1593-1597  
Detached positions were taken (Fix #593-597) on the rock, the pile and two piers off the south end of Brooks Island. All 4 D.P.'s agreed exactly with those on Chart 18649. The west pier should be charted as ruins on future charts. It should be noted that no field edit was required for this area. See E.R. Sect 6, H7705. ✓

A dive investigation was performed on the submerged pile at the west end of Berkeley pier. The pile no longer exists but the ruins at the end of the pier still remain; therefore, it is recommended that the submerged pile be removed from the chart. For more information, refer to Dive Investigation Report, OPR-L123-RA-78. See FE-242, Awois Item 50561, for description of this feature.

~~The 20 foot shoal charted east of Treasure Island (37°49'44"N, 122°~~

from H 7619 (1947) Add wk 1950

The 20 foot shoal charted east of Treasure Island ( $37^{\circ}49'44"N$ ,  $122^{\circ}21'23"W$ ) was developed with 10 meter spacing. The shoalest point found was 29 feet at the same position; therefore, it is recommended that this shoal be charted as 29 feet. For details see RA 10-38-78, Expansion #2, 1:5,000 scale. It was also noted that the 30 foot depth curve no longer extends down to  $37^{\circ}49'44"N$ ,  $122^{\circ}21'37"W$ . The entire finger shaped curve has been scoured to an average depth of 34 feet. This is also shown on Expansion #2 (RA 10-38-78). \* Do not concur, the 20 ft has been carried forward from H-7619.

The wreck charted at 68 feet ( $37^{\circ}48'58"N$ ,  $122^{\circ}22'53"W$ ) was investigated by hydrographic development with 10 meter spacing. The wreck was found to be in the exact same position but at a depth of 70 feet. Refer to C/L 716/76 Item 22. Chart present survey information \* uncorrected depth in some areas

When comparing the survey to the chart, soundings along the rapid transit tunnel are deeper by an average of 15 feet. This change in depth could be caused by the excavation work done while constructing the tunnel. ✓

There are a number of charted pier ruins along the east shore of

Treasure Island that no longer exist. For details on these ruins see field edit sheet TP 00529.

SEE  
ER  
Sect 6

H 7622

#### M. ADEQUACY OF THE SURVEY

This survey (H-9794) is complete and adequate to supersede all prior surveys for charting purposes. All fathograms were scanned and checked for peaks and deeps and appropriate changes made to the original records where necessary.

SEE  
ER  
Sect 6

#### N. AIDS TO NAVIGATION

Detached positions were taken on 17 buoys in the survey area (H-9794). All but one of these are charted on either Chart 18649 or Chart 18650. The following is a comparison of the buoys' present positions with their charted positions:

1.\* This is a spherical white and orange horizontally striped buoy that is not found in the USCG Light List, 1978. The buoy is located 30 feet south of an exposed rock, southeast of Point Blunt on Angel Island. The detached position was taken on the exposed rock, not the buoy. It is recommended that the charted position of the buoy remain the same. Concur. ✓

2. This buoy is one of seven white and orange horizontally striped buoys located south of Brooks Island. This buoy is a can buoy where the rest are spherical. It is designated SPC on Chart 18649. It is recommended that it be designated SPC "SH" in the future. All seven Concur of these special purpose buoys are used by Berkeley Yacht Club for racing course markers. ✓

\*These notes are listed on Charted Buoy Comparison.

				<i>data from H-9793</i>

3. This is the only buoy not found on the chart. It is a spherical orange and white horizontally striped racing buoy designated WOrSP "M". It is located to the north of Pier 2 at Fort Mason. It is recommended that it be charted at  $37^{\circ}48'39''N$ ,  $122^{\circ}25'54''W$ . Black Point SEE  
ER  
Sect 7c

All of the buoys above that are Coast Guard maintained are located in the USCG Light List 1978. The remaining buoys are privately maintained and not found in the Light List. ✓

It is recommended that the present positions obtained by the RAINIER be used to supersede all prior positions. Refer to Horizontal Control Report OPR-L123-RA-78 and NOAA Form 76-40, Non-Floating Aids to Navigation and Landmarks for information on geodetically located fixed aids to navigation. ✓

#### O. STATISTICS

The survey contains 5944 positions in 667.2 nautical miles of hydrography, covering 20.3 square nautical miles. The following is a breakdown of the survey statistics:

<u>Vessel</u>	<u>No. of Positions</u>	<u>N. M. Hydrography</u>	
RA-3 (2123)	608	40.0	✓
RA-5 (2125)	207	*	
RA-6 (2126)	5129	627.2	

\*Launch RA-5 was used for obtaining bottom samples on H-9794. There were 176 bottom samples taken during the survey.

In addition, one tide station was maintained during the survey. For additional information refer to Field Tide Note, OPR-L123-RA-78; Echo Sounding Report, OPR-L123-RA-78; and the Abstract of Positions for details regarding the positions used by each launch.

#### P. MISCELLANEOUS

The walk hydrography completed along the pier faces and bulkheads extending east from Port Mason Pier #1 was not smooth plotted. The raw data (sounding volumes, ~~raw~~ master printouts, ~~raw~~ master tape, and corrector tape) only were submitted to PMC. SEE E.R.  
Sect 1  
contains prov'd. fixed

#### Q. RECOMMENDATIONS

The survey is complete and adequate to supersede all previous hydrography in the area, with exceptions noted. SEE  
ER  
Sect 9

Due to the rapid shifting of bottom sediments in the Bay Area, the rapid changes to shoreline topography, and the increasing volume of deep draft and dangerous cargo vessels calling in San Francisco, it is recommended that a Chart Evaluation Survey be scheduled for San Francisco Harbor every 5-10 years. ✓

R. DATA PROCESSING PROCEDURES

Data acquisition and processing were accomplished per instructions in the Hydrographic Manual, Fourth Edition, 1976 and the PMC OPORDER.

Soundings and positions were taken by a Hydroplot system using range-range program RK 111 or visual programs RK 171, RK 175, and RK 176. There are daily master tapes and corresponding corrector tapes which include the TRA for the launches, electronic control calibration correctors, and all depth corrections. Velocity tapes were generated from Nansen Cast Data. The following is a list of all computer programs and version dates used during the survey. ✓

<u>PDP 8/e</u>		<u>Version Date</u>
RK 111	Range-Range Real Time Hydroplot	01/30/76
RK 171	Visual Hydrolog Loader	05/18/76
RK 175	Visual Hydrolog	05/03/76
RK 176	Visual Hydrolog Restarter	05/01/74
RK 201	Grid, Signal, and Lattice Plot	07/12/75
RK 211	Range-Range Non Real Time Plot	01/15/76
RK 212	Visual Station Table Load and Plot	04/01/74
RK 215	Visual Non-Real Time Plot	08/16/74

Ensign, NOAA

FIELD TIDE NOTE  
OPR-L123-RA-78  
H-9793 , H-9794  
San Francisco Bay, California

The Presidio tide station (#941-4290) was utilized as the control gage for tidal datums with predicted tides being generated using PROGRAM AM 500, PREDICTED TIDE GENERATOR (version November 10, 1972). One historic tide station was occupied and monitored by a contract tide observer. The gage was operated on Pacific Standard Time to maintain uniformity with the gages that were installed by the California Tide Party.

T1, Pier 22 1/2, 941-4317

The tide station at LAT  $37^{\circ} 47'25"N$ , LONG  $122^{\circ} 23'13.5"W$  was occupied from September 25, 1978 to November 22, 1978. A Fisher-Porter ADR gage, SN 7304A1380M11, was installed with 9.90 feet on the gage corresponding to 0.00 feet on the tide staff. Metric installation levels and removal levels, connecting the tide staff to 5 benchmarks, were run on September 23, 1978 and November 20, 1978 respectively.

Difference of Elevations		
	September 23, 1978	November 20, 1978
staff stop - BM 179	+0.926 m	+0.922 m
BM 179 - BM 1	+1.391 m	+1.394 m
BM 1 - BM M329	-0.398 m	-0.400 m
BM M329 - BM V813	-0.161 m	-0.164 m
BM 1 - BM DD109	+4.767 m	+4.764 m

Staff to gage comparison observations were conducted on September 26, 1978 from before high tide to after low tide with a total of 35 observations for comparison. The maximum deviation from the mean observation was 0.09 feet, as the upper bound, and 0.08 feet, as the lower bound.

The time was reset for this gage on two separate occasions, the first for being 3 minutes fast and the second for being 6 minutes fast. From 1206 L on November 20, 1978 to 1136 L on November 21, 1978 the gage double punched or punched intermittently and as such the data is suspect.

T1 to Predicted Tide Comparison

A table comparing T1 data with predicted tides for three distinct three day sequences follows, in the format of time of high, time of low, and tidal range. All times are local.

	Predicted Tides	T1
September 27, 1978	2046 0230 4.84 feet	2030 0221 4.91 feet
September 28, 1978	2136 0310 5.06 feet	2121 0300 5.24 feet
September 29, 1978	2220 0344 5.06 feet	2212 0324 5.31 feet
October 10, 1978	1829 0018 5.72 feet	1824 0006 5.78 feet
October 11, 1978	1949 0121 5.72 feet	1954 0106 5.99 feet
October 12, 1978	0907 0216 6.05 feet	0851 0203 5.88 feet
November 13, 1978	1031 1707 7.48 feet	1027 1645 7.27 feet
November 14, 1978	1106 1746 7.48 feet	1054 1739 7.40 feet
November 15, 1978	1142 1825 7.37 feet	1148 1833 7.34 feet

#### Recommended Zoning

Zoning is recommended using the discrete tidal zoning method due to tidal differences within the broad survey limits on H-9793 and H-9794.

#### Comments

The remaining tide gages, as called for in the project instructions dated August 10, 1978, were installed, operated, and maintained by the California Tide Party.

APPROVAL SHEET  
DESCRIPTIVE REPORT TO ACCOMPANY  
HYDROGRAPHIC SURVEY

H-9794

RA-10-3-78

In producing this sheet, standard procedures were observed in accordance with the Provisional Hydrographic Manual, PMC OPORDER, and the Instruction Manual for Automated Hydrographic Surveys. The data was examined daily during the execution of the survey.

The boatsheet and accompanying records have been examined and are complete and adequate for charting purposes and are approved.

## TIDE NOTE FOR HYDROGRAPHIC SHEET

Processing Division: Pacific      Marine Center:

Hourly heights are approved for

Tide Station Used (NOAA Form 77-12): 941-4290 San Francisco, CA  
941-4317 San Francisco Bay, CA

Period: September 26 - November 18, 1978

HYDROGRAPHIC SHEET: H-9794

OPR: L 123

Locality: San Francisco Bay, California

Plane of reference (mean lower low water): 3.25 ft. - San Francisco Bay (941-43)

Height of Mean High Water above Plane of Reference is  
5.5 ft. - zone 1; 5.2 ft. - zones 2 and 3

Remarks: Recommended zoning:

- (1) South of a line extending from  $37^{\circ}47.9'N$ ,  $122^{\circ}23.8'W$ , to  $37^{\circ}49.1'N$ ,  $122^{\circ}22.0'W$ , and then to  $37^{\circ}49.3'N$ ,  $122^{\circ}19.8'W$  zone direct on San Francisco Bay.
  - (2) North and east of a line extending from the northwest tip of Treasure Island to Point Blunt on Angel Island zone on San Francisco applying +20 minute time correction and range ratio x1.03.
  - (3) South and west of the line in (2) zone on San Francisco applying +10 minute time correction and range ratio x1.03.

James R Hubbard  
Chief, Datums and Information Branch

PACIFIC MARINE CENTER  
EVALUATION REPORT  
H-9794

1. INTRODUCTION

H-9794 is a basic hydrographic survey of a portion of San Francisco Bay, conducted in accordance with the Project Instructions for OPR-L123-RA-78, San Francisco Bay, California, dated August 10, 1978, Change 1, dated August 21, 1978 and Change 2, dated August 28, 1978.

This survey extends from the San Francisco waterfront and latitude 37°48'00"N north to 37°53'50"N and between longitudes 124°21'00"W and 122°26'00"W. This includes the downtown San Francisco waterfront from Aquatic Park to Pier 15, Alcatraz Island, Treasure and Yerba Buena Islands, eastern Angel Island and southern Brooks Island. Survey depths range from 186 feet south of Point Blunt to the MLLW at Brooks Island. This area is characterized by strong currents and a changing sea floor to the south and west and a shoal, mud bottom to the northeast. The area is heavily developed and trafficked.

H-9794 was previously approved for chart application on May 14, 1981. The quality control inspection noted discrepancies in the survey, so it was returned to the marine center for additional processing. It was further determined that additional field work would be required to resolve some of the noted discrepancies. This additional field work was accomplished in 1983 by NOAA Ship RAINIER and processed as FE-242. The areas superseded by FE-242 are delineated on H-9794. The evaluator's report, the smooth sheet, and the automated file have been revised in accordance with the quality control inspector's comments.

Lead line soundings along the pier faces were plotted on an overlay which has been inserted into the Descriptive Report. The soundings are shown at half-size so as to incorporate more data and avoid congestion with the pier faces and depth curves. It must be emphasized that the overlay shows shoaler depths than those shown on the smooth sheet.

Soundings plotting on piers were manually offset. The approximate positions of the areas of these soundings are;

Latitude 37°49'47"N, Longitude 122°21'54"W	Treasure Island
Latitude 37°48'56"N, Longitude 122°22'09"W	Treasure Island
Latitude 37°48'30"N, Longitude 122°25'48"W	Black Point
Latitude 37°48'30"N, Longitude 122°25'00"W	Fisherman's Wharf
Latitude 37°48'35"N, Longitude 122°24'39"W	Piers 39 and 41
Latitude 37°49'12"N, Longitude 122°22'27"W	Treasure Island
Latitude 37°48'08"N, Longitude 122°23'50"W	Pier 17
Latitude 37°48'15"N, Longitude 122°24'00"W	Pier 27

Duplicate position numbers exist for positions 2046, 2047, 2051 and 2052.

Projection parameters used to prepare the smooth field sheet have been revised to center the hydrography on the smooth sheet. Parameters used by the Pacific Marine Center are appended to the smooth printout.

Predicted tides for the Presidio tide station were used to reduce soundings on the field sheet. Approved tides from San Francisco tide station were used for the final reduction on the smooth sheet.

## 2. CONTROL AND SHORELINE

Horizontal control and positioning are adequately described in Sections F and G of the Descriptive Report, and the Horizontal Control Report, OPR-L123-RA-78.

Horizontal control station positions used to plot this survey are published and unadjusted field positions based on the North American 1927 Datum.

Three stations, 106, 313, and 344 (on Treasure Island and Yerba Buena Island), on the present survey were found to be misplotted by as much as 5 meters on reviewed shoreline map TP-00529. Two stations, 313 and 344 (a radar tower on Yerba Buena Island and a radio tower on Treasure Island), are charted landmarks. The present survey positions should be used for these landmarks.

The shoreline was applied using the following reviewed Class I manuscripts:

	<u>Scale</u>	<u>Dates of Photography</u>	<u>Date of Field Edit</u>
TP-00526	1:20,000	March 1977	November 1978 April 1979
TP-00527	1:20,000	March 1977	April 1979
TP-00528	1:10,000	March 1977 May 1981	October 1978
TP-00529	1:10,000	March 1977	November 1978

The shoreline in the vicinity of North Point, latitude  $37^{\circ}48'36"N$ , longitude  $122^{\circ}24'36"W$ , at piers 41, 39, and former pier 37 (Presurvey Review Item 12) has undergone major reconstruction (which includes a new marina) since the original compilation of TP-00528. During final review this section of shoreline was recompiled from revision photography of May 1981. The new high water line delineation is shown on the present smooth sheet.

The rock on the east side of Bird Island is not shown on TP-00527 (see position 1593, latitude  $37^{\circ}53'45"N$ , longitude  $122^{\circ}21'28"W$ ). Recommend charting as a rock uncovering 7 feet at MLLW.

The two piers shown on the smooth sheet along the south shore of Brooks Island in the vicinity of latitude  $37^{\circ}53'39"N$ , longitude  $122^{\circ}21'15"W$  are plotted from the field sheet without supporting positional information. They are shown as submerged ruins from comments in the raw records. The area is depicted as foul with ruins on TP-00527.

TP-00528 depicts the ruins of Berkeley Pier as a dashed double line feature and on the adjoining manuscript, TP-00527, it is shown as a dashed single line. This is due to the difference in scales between TP-00527 (1:20,000) and TP-00528 (1:10,000) and it is recommended that the ruins remain as charted.

### 3. HYDROGRAPHY

Crosslines are in excellent agreement with the main scheme soundings. Soundings agree within one foot. The differences are probably caused by a slight difference in positioning.

The bottom configuration and least depths are adequately determined. Standard depth curves could be adequately drawn except along the waterfront. The 36-foot and 90-foot supplementary curves were added to the smooth sheet to conform to the published chart. The 90-foot supplementary curve is inadvertently shown in violet.

In the vicinity of latitude 37°53'20"N, longitude 122°25'50"W, north of Angel Island, for an approximate radius of 300 meters, significant sand ridges rising up to 15 feet off the bottom were detected on the graphic record. The soundings were scanned and only the shoalest values were selected for plotting on the smooth sheet.

There were 176 bottom samples taken during this survey and it was determined that the bottom consists mainly of sand and mud.

### 4. CONDITION OF SURVEY

The hydrographic records and reports are adequate and conform to the requirements of the Hydrographic Manual, 4th edition, revised through Change 3, with the exception of:

a. The station listed as Berkeley Breakwater Light 2 1978 (Signal 322) is Berkeley Marina Channel Light 2 in the 1978 Light List. This difference should have been noted in the Descriptive Report (Section 4.5.13.1 of the Hydrographic Manual).

b. Numerous rocks and islets around Angel Island were not investigated by the hydrographer (Section 4.1.1.7 of the Hydrographic Manual). These features were carried forward as awash from the prior survey.

c. A Chart Adequacy Survey of 1976 (Chart Letter 716 of 1976, item 55) substantiates the existence of ruins around Treasure Island and Yerba Buena Island. The present survey is considered deficient in that it failed to ascertain least depths with any suitable method such as drift soundings with a hand lead, intensive development by echo sounder, or possibly an improvised wire drag in areas where piers and ruins existed in the prior survey and on the charts. As a result, the ruins had to be carried forward from the prior survey during office processing (Section 4.5.8 of the Hydrographic Manual).

d. The pier areas at North Point were not adequately investigated. As a result, additional field work is being requested to confirm or disprove the existence of pier ruins.

e. Soundings along pier faces were controlled using the "see field sheet method" and subsequently provided with pseudofixes in the field to facilitate plotting. Many of the angles (resection angles) provided were geometrically weak which resulted in erroneous positions. "See field sheet" soundings were plotted directly on the smooth sheet without supporting positional information.

#### 5. JUNCTIONS

H-9794 junctions to the west with H-9793 (1978). Soundings and depth curves are in agreement. Several soundings were transferred from H-9793 to accomplish the junction of depth curves.

H-9811 (1979) and H-9810 (1979) junction to the north and east respectively. The soundings and depth curves are in good agreement.

H-9794 junctions with H-9844 (1979) to the south. Soundings and depth curves are in agreement, however, the junction note on H-9844 is shown as adjoins since H-9794 had been previously processed.

#### 6. COMPARISON WITH PRIOR SURVEYS

H-7619 (1947-50)	1:10,000
H-7620 (1947)	1:10,000
H-7621 (1947)	1:10,000
H-7622 (1947)	1:5,000
H-7704 (1948-51)	1:10,000
H-7705 (1948)	1:10,000
H-7706 (1948-49)	1:5,000
H-7716 (1948)	1:5,000

#### H-7619

H-7619 is common to the southeast portion of the present survey. It includes the offshore area around Treasure Island and extends north to latitude  $37^{\circ}52'00''W$ . Soundings from H-7619 generally agree with the present survey within 1 to 5 feet.

Southeast of Yerba Buena Island in the vicinity of latitude  $37^{\circ}48'22''$ , longitude  $122^{\circ}21'18''W$ , adjacent to the charted tunnel area, depths are as much as 30 feet deeper on the present survey, probably attributable to scouring.

The V-shaped pier and dolphin at the end of the Berkeley Pier, latitude  $37^{\circ}50'52''N$  longitude  $122^{\circ}21'34''W$ , were not found during this survey. They were further investigated and ruins disproved by wire drag on FE-242 (1983). Refer to FE-242, AWOIS Item 50561, for additional information on these features.

The following depths were carried forward to the smooth sheet due to inadequate investigations of shoals during the present survey.

<u>Depth (ft)</u>	<u>Latitude N</u>	<u>Longitude W</u>
20	37°49'44"	122°21'23"
20	37°49'39"	122°22'48"
15	37°49'56"	122°22'41"

#### H-7620

H-7620 is common to the present survey in the area north of Angel Island. The prior survey soundings are from 0-5 feet shoaler or deeper than those on the present survey.

#### H-7621

H-7621 is common to the present survey in the area south of Angel Island to just north of the waterfront. The sounding differences between this and the present survey vary widely.

In the area of the 40-foot shoal on the prior at latitude 37°49'48"N, longitude 122°25'07"W, there are now depths of 61, 64 and 65 feet.

At latitude 37°49'44"N, longitude 122°24'44"W, in the vicinity of PSR Item 25, there is a 43-foot sounding on the present survey, compared to 60, 63, and 64 feet on the prior.

There is a shoal on the present survey south of Alcatraz Island in the vicinity of latitude 37°49'20"N, longitude 122°25'14"W, with a minimum observed depth of 50 feet. The shoalest depth in the area on the prior is 112 feet, the difference is attributed to the deposition of spoil. This area is within the charted "Discontinued Dumping Ground". See Section 7 of this report for additional information on this feature.

The shoal area in the vicinity of latitude 37°49'06"N, longitude 122°25'03"W shows 60 feet on present survey compared to 52 feet on the prior.

A 45-foot sounding at latitude 37°48'49"N, longitude 122°24'06"W, and the annotation "rocky" have been carried forward from H-7621, as the shoal on the prior is substantiated by the present survey.

In the area covered by H-7621, there are strong currents, tide rips and eddies. This is especially true of the area northeast and south of Alcatraz Island. These conditions in conjunction with a soft bottom would tend to create the large differences from the prior survey depths.

The entire area in the vicinity of Alcatraz Island and west has been subsequently superseded by FE-242. The smooth sheet has been annotated with a limit line defining this area.

H-7622

This survey consists mainly of the shoreline soundings around Treasure Island and Yerba Buena Island. Sounding differences vary between 0-5 feet, except for the cove between the two islands. Extensive shoaling has occurred in the cove, with depths up to 15 feet shoaler.

Many piers and piles around Treasure Island and Yerba Buena Island were not verified or disproved. They have been carried forward as submerged features at the following locations:

	<u>Latitude</u>	<u>Longitude</u>
Dolphin	37°49'44"N,	122°21'50"W
Pier	37°49'42"N,	122°21'54"W
Pier	37°49'30"N,	122°21'45"W
Pier & dolphins	37°49'21"N	122°21'39"W
Pier & dolphins	37°48'49"N	122°22'06"W
Pier & dolphins	37°48'43"N,	122°21'33"W
Piling	37°49'02"N,	122°22'18"W
Piling	37°49'21"N,	122°22'31"W
Pier	37°48'30"N,	122°22'37"W 07"
Pier	37°48'49"N,	122°21'45"W
Piers	37°48'59"N to 37°49'06"N	122°21'51"W to 122°22'07"W

H-7704

H-7704 is common to the present survey in areas around Angel Island. Soundings comparisons range from 0-4 feet deeper on H-9794. Exceptions are as follows:

The area northeast of Angel Island presently shows two isolated deeps with depths up to 14-feet deeper than on the prior survey.

The shoreline in the Point Campbell area has receded approximately 40-50 meters.

The area north of latitude 37°50'49"N to latitude 37°51'15"N and west of longitude 122°24'50"W has been superseded by FE-242(1983) with the exception of two islets at latitude 37°51'16.7"N, longitude 122°25'29.7"W, and latitude 37°51'16.9"N, longitude 122°25'29.8"W. These features are depicted as a rock awash on the present survey. Refer to FE-242 for the comparison within this area.

Numerous rocks, an outfall, a submerged pier ruin, and a dolphin not addressed by the hydrographer were carried forward to the present survey.

H-7705

H-7705 is common to the northeast portion of the present survey. Sounding differences vary from 0-4 feet with shoaler depths on the present survey. One exception is a 12-foot deep at latitude  $37^{\circ}53'09"N$ , longitude  $122^{\circ}21'09"W$ , compared to 6 feet on the prior.

A dolphin located independently by both the present hydrographic (position 1594) and topographic surveys is located approximately 20 meters west of hydrographically determined signal BOS (latitude  $37^{\circ}53'35"N$ , longitude  $122^{\circ}21'12"W$ ). A description of the signal is not provided by H-7705 however, a pile charted in the vicinity was described by N/CG241 as originating with this prior survey. A pile was not carried forward to the present survey inasmuch as the dolphin is probably the same item.

H-7706, H-7716

These two prior surveys cover that portion of the San Francisco waterfront included in this survey. The soundings on H-9794 in Aquatic Park vary from being 2 feet deeper inshore to 4 feet shoaler near the entrance. An exception is the area in the vicinity of latitude  $37^{\circ}48'37"N$ , longitude  $122^{\circ}25'21"W$ , where there are 20-foot soundings, compared to 15 feet on the prior.

There apparently has been dredging along some of the piers as evidenced by the large variation of soundings ranging from 14 feet shoaler to 17 feet deeper.

There have been extensive cultural changes to the shoreline. Most notable is the reconstruction of the Pier 39 complex, discussed in Section 2, "Control and Shoreline", which also includes Pier 37 (Presurvey Review Item #12) and Pier 41.

Portions of Piers 41, 43, and 47A at latitude  $37^{\circ}48'40"N$  longitude  $122^{\circ}24'44"W$ , latitude  $37^{\circ}48'38"N$ , longitude  $122^{\circ}24'49"W$  and latitude  $37^{\circ}48'35"N$ , longitude  $122^{\circ}25'06"W$  respectively, did not appear on the shoreline map and were not considered disproved by the present survey. They were, however, investigated on FE-242 (1983). Refer to FE-242 Item 14, 15, and 16 for the disposition of these features.

Piers 25, 27, and 29 in the vicinity of latitude  $37^{\circ}48'27"N$ , longitude  $122^{\circ}24'00"W$  have been reconstructed; pier 37 (PSR Item 12) in the vicinity of latitude  $37^{\circ}38'35"N$ , longitude  $122^{\circ}24'27"W$ , has been removed and replaced with a small craft facility and breakwater. The hydrographer failed to specifically address the possibility of submerged remains in the prior pier locations, therefore the disposition of the prior piers is unknown. However, there is minimal chance the submerged hazards remain in the area since these present facilities are substantial and are apparently in continuous use. No submerged remains have been carried forward to the present survey.

With the exception of features carried forward from the prior surveys and the areas common to FE-242, H-9794 is adequate to supersede all prior surveys within common areas.

7. COMPARISON WITH CHART

18650 (34th Ed., May 20, 1978)  
18649 (45th Ed., February 4, 1978)

a. Hydrography

The charted hydrography originates with the previously discussed prior surveys which require no further consideration, supplemented by U.S. Army Corps of Engineer surveys, various chart letters (e.g. Chart Adequacy Surveys, Chart Letter 716 of 1976, and Chart Letter 967 of 1976), and blue-prints.

PSR Items #8 and 26 were investigated and are adequately discussed by the hydrographer in section K.

The following pre-survey review item discussed in Section K of the Descriptive Report is supplemented as follows:

PSR Item #25, is described as a "44 foot sounding" charted at latitude  $37^{\circ}49'44''N$ , longitude  $122^{\circ}24'45''W$ . In addition to the 43-foot shoal mentioned by the hydrographer, there is a 42-foot shoal 200 meters to the northwest. The charted depth is superseded by the present survey. It is recommended that the area be revised from present survey information.

The two charted discontinued dumping grounds originating with Chart Letter 1300 of 1971 in the vicinity of latitude  $37^{\circ}49'18''N$ , longitude  $122^{\circ}25'09''W$  (south of Alcatraz Island) have been reactivated and the limits revised by the U.S. Army Corps of Engineers, as addressed in Chart Letter 147 of 1982. A shoaler depth of 50 feet (not necessarily the least depth) was observed during the present survey and reported through Local Notice to Mariners 10 of 1982. This 50-foot sounding was investigated during FE-242 (1983), where it is identified as AWOIS Item 50571 (PSR Item 11). FE-242 superseded the results of the present survey.

The charted discontinued dumping ground in the vicinity of latitude  $37^{\circ}48'36''N$ , longitude  $122^{\circ}22'36''W$  (west of Yerba Buena Island) was not intensively investigated during the present survey; however, the area was surveyed at 100-meter line spacing. It is recommended charted depths within the limits of this dumping ground be revised from the present survey and from CL-716 of 1976, a Chart Adequacy Survey.

The dolphin charted at latitude  $37^{\circ}51'16.1''N$ , longitude  $122^{\circ}25'04.1''W$  (Point Blunt) which originates from Chart Letter 545 of 1963 (as several dolphins) was not verified or disproved by the present survey and should remain as charted.

b. Controlling Depths

There are no channels with controlling depths within the limits of this survey.

c. Aids to Navigation

All fixed and floating aids to navigation adequately mark the features intended. With the exception of the white and orange buoys located south of Brooks Island, they compare well with the charted positions. These buoys may be frequently moved, since they are reported to be racing buoys.

The positioning data and description for the uncharted buoy at latitude 37°48'39"N, longitude 122°25'54"W, was included in the junction survey H-9793. The data was incorporated into this survey, since the buoy is within its limits. (See position 2845, DN 322, vessel 2123, and the position/sounding printout.)

The fixed aid at the end of Berkeley Pier at latitude 37°50'52.1"N, longitude 122°21'34.1"W, was listed by the hydrographer as Berkeley Breakwater Light 2. The correct name according to the 1978 Light List, is Berkeley Marina Channel Light 2.

Geographic names shown on the smooth sheet originate from the charts discussed in this section, as well as TP-00526 and TP-00528, except for Piers 43 and 47 which originate from T-5923 and BP-95006, respectively.

With the exceptions included in this section, H-9794 is adequate to supersede charted hydrography.

8. COMPLIANCE WITH INSTRUCTIONS

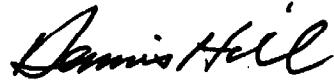

With the exception of the items listed in Section 4, this survey adequately complies with the Project Instructions.

9. ADDITIONAL FIELD WORK

This is an adequate hydrographic survey. Many of the items requiring additional field work were identified and investigated as part of FE-242 (1983). Additional items are identified in Section 2, 4, 6, and 7. The investigation of these features should be considered prior to the completion of Project OPR-L123.

*J. S. Green*  
James S. Green  
Cartographer

This survey has been examined and it meets Charting and Geodetic Services standards and requirements for use in nautical charting. The survey is recommended for approval.

AUG 20 1986 MOP211/JG

TO: N/OG2 - J. Austin Yeager  
*J. C. Austin*  
FROM: N/MOP - Robert L. Sandquist  
SUBJECT: Additional Processing of Survey H-9794  
REF: C35 Memorandum dated September 9, 1982, "Return of Survey H-9794 for Additional Verification"

The additional processing required in the referenced memorandum has been completed and H-9794 is resubmitted.

Several of the noted items were resolved by additional field work on FE-242 (1983). Those areas superseded by FE-242 are so noted on the H-9794 smooth sheet and in the descriptive report. FE-242 supplements other charted areas in this vicinity so it should be referred to by the nautical chart compiler for additional information.

Specific processing requirements were identified on attachments to the C35 memorandum referenced above. The actions and/or comments related to each specific processing requirement are summarized on an attachment to this memorandum.

With the completion of this processing, Survey H-9794 is considered adequate for use in revising nautical charts within the common area.

cc: N/MOP21

H-9794 Processing Comments

a. Attachment A - Horizontal Displacement of Sounding Data.

The resurvey of the areas south of Angel Island and the vicinity of Alcatraz Island on FE-242 resulted in supersession of the areas questioned in this attachment except for the items in the vicinity of Pier 39. Revised shoreline is now shown on H-9794 and soundings have been adjusted or rejected as necessary.

b. Attachment B - Smooth Sheet Changes, not related to Attachment A.

The positional discrepancies on the north shore of Angel Island were resolved by rejecting positions 308401 to 308701. Descriptive information regarding rocks, ruins, and pipes was retained on the smooth sheet as considered appropriate.

c. Attachment C - Background Information

No action was required.

d. Attachment D - Deficiencies to be Addressed or Corrected.

The corrective actions requested in this attachment have been accomplished except for providing the expansion field sheets, which are no longer available.

e. Attachment E - Copies of the Descriptive Report and Verifier's Report.

The comments noted on copies of the Descriptive Report and Verifier's Report along with those contained in Attachment F - Additional Comments and Recommendations, have been considered and the Descriptive Report has been annotated. An Evaluation Report considering these comments has been written to supersede the Verifier's Report.

f. Attachment F - Additional Comments and Recommendations.

Attachment F comments and recommendations were written in relation to the format of the Verifier's Report. They have been incorporated into the Evaluation Report considering the results of FE-242 and current Hydrographic Section procedures.

g. Attachment G - Correction Overlay of Smooth Sheet.

The corrections noted on the smooth sheet overlay have been applied to H-9794 smooth sheet considering FE-242 and current Hydrographic Section procedures.

h. Attachment H - Supportive Data.

No actions were required by this attachment.

C352:RWD

TO: CPM3 - Ned C. Austin  
FROM: C35 - Glen R. Schaefer *Glen R. Schaefer*  
SUBJECT: Return of Survey H-9794 for Additional Verification  
REF: C35x1:DEW memo, 9/7/82

It was determined during quality evaluation that a significant horizontal control problem exists on Survey H-9794 (1978), California, San Francisco Bay, Yerba Buena Island to Brooks Island, due to incomplete digital sextant information. The present smooth sheet also reflects erroneous actions and decisions made during verification. Additional complications have resulted from inadequate photogrammetric support on this project. Therefore, I am requesting you to revise parts of the Descriptive Report, Verifier's Report, and smooth sheet so that the present survey can be considered adequate for charting purposes. Specific explanations, which will assist the verifier to address and/or resolve problems, are contained in the following attachments:

- A. Horizontal Displacement of Sounding Data.
- B. Smooth Sheet Changes, not Related to Attachment A.
- C. Background Information for reviewed shoreline maps and NOAA forms 76-40 submitted subsequent to verification of the present smooth sheet.
- D. Deficiencies to be Addressed or Considered.
- E. Copies of the Descriptive Report and Verifier's Report (being forwarded under separate cover). These reports have comments and recommendations annotated in blue which the verifier may wish to address or consider. Other notations in red are to be inked in the Descriptive Report or added to the Verifier's Report when typed.
- F. Additional Comments and Recommendations. This attachment is keyed to the Verifier's Report by section headings, such as 1. INTRODUCTION; and contain statements which are to be included in the final retyped report after appropriate actions have been made. These statements are preceded by a single asterisk (\*). Statements preceded with a double asterisk (\*\*) are for general information.
- G. Correction overlay of smooth sheet (being forwarded under separate cover).

H. Supportive data. Copies of chart letters, blueprints, work overlays, etc. are being forwarded under separate cover. Hydrographic Maintenance Prints of TP-00526 through 529, pertinent copies of NOAA form 76-40, and copies of the Chart Adequacy Surveys of 1976 (Chart Letters 716 and 967 of 1976 with their pertinent accompanying blueprints) have been previously forwarded to CPM3 under separate cover.

Questions related to the attachments should be directed to Mr. Robert W. DerKazarian (C352), telephone 443-8266.

ATTACHMENT TO DESCRIPTIVE REPORT FOR H-9794

I have reviewed the smooth sheet, accompanying data, and reports of this hydrographic survey. Except as noted in the Evaluation Report, the hydrographic survey meets or exceeds Charting and Geodetic Services (C&GS) standards, complies with instructions, and is accurately and completely represented by the smooth sheet and digital data file for use in nautical charting.

(Signature) 8/20/86  
Chief, Nautical Chart Branch (Date)

Hydrographic Index No. 96M

H9794

**NAUTICAL CHART DIVISION**

## **RECORD OF APPLICATION TO CHARTS**

FILE WITH DESCRIPTIVE REPORT OF SURVEY NO. 9794

## **INSTRUCTIONS**

A basic hydrographic or topographic survey supersedes all information of like nature on the uncorrected chart.

1. Letter all information.
  2. In "Remarks" column cross out words that do not apply.
  3. Give reasons for deviations, if any, from recommendations made under "Comparison with Charts" in the Review.
