

project.

Predicted tides based on the Seldovia, Alaska tide gage with time and range adjustments were utilized during shipboard processing. Tide correctors used for the reduction of the final soundings are computed from approved hourly

heights from one temporary bubbler tide gage, Port Chatham, Alaska (945-5428). During verification, the following was changed:

- a. Projection parameters were changed to center the hydrography on the smooth sheet and to change the projection to polyconic.
- b. Tide level values are from observed tides, see form 712.
- c. Electronic correctors were revised to reflect the mean of baseline correctors.
