

This survey was conducted using predicted tides based on daily predictions for Hampton Roads, Virginia, (863-8610). Predicted tides were generally applied during online operations using program RK 112. Predicted tides were applied offline during processing whenever online application was omitted. A copy of the predicted tide printout is included with the field records. Smooth tides were requested from the Chief, Tides and Water Levels Branch (OA/C23) on 19 November, 1982 for the period of this hydrographic survey.
