A. Project

This survey was conducted during the 1987 field season in accordance with Project Instructions OPR-0186-FA-87, Icy Strait, Alaska, dated July 29, 1986; Change No. 1 dated August 4, 1986; Change No. 2 dated December 24, 1986; Change No. 3 dated February 2, 1987; Change No. 5 dated April 13, 1987; Change No. 6 dated April 29, 1987; and Change No. 7 dated July 28, 1987. PMC OPORDER, the Hydrographic Manual (fourth edition), and the Hydrographic Survey Guidelines are also applicable. ✓ See sect. I of Eval. Report

This 1:10,000-scale survey sheet is designated as sheet "Q" in the project instructions. The purpose of this survey is to provide contemporary hydrographic data for the existing charts of Lynn Canal. ✓

B. Area Surveyed

This survey covers Lynn Canal in the vicinity of Point Howard, west of longitude 135/00/00W. It is bounded to the west by the shoreline, to the south by latitude 58/14/48N and the shoreline, and to the north by latitude 58/20/00N and the shoreline. ✓

This survey commenced on May 13, 1987, (DN 133) and was temporarily suspended for Alaska Peninsula operations on May 16, 1987 (DN 136). Survey operations resumed on October 4, 1987, (DN 278) and were completed on October 29, 1987 (DN 302). ✓

C. Sounding Vessels

Jensen survey launches FA-3 (2023), FA-4 (2024), and FA-6 (2026) were used to acquire hydrographic and shoreline verification data. Jensen survey launch FA-5 (2025) was used to acquire hydrographic data and collect bottom samples. FAIRWEATHER (2020) conducted all sound velocity casts and collected bottom samples. Shoreline verification was completed by FA-7 (2027), FA-8 (2028), and FA-10 (2030). ✓

On October 29, 1987, (DN 302) 3 islets were located by using a theodolite and an EDMI to delineate their limits. These range/azimuth positions, 9200 to 9208, are plotted in red on the final ~~field~~ smooth sheet at 58/15/02, 135/03/24; 58/15/43, 135/04/03; 58/15/56, 135/04/11 ✓

D. Sounding Equipment and Corrections to Echo Soundings

FAIRWEATHER's four survey launches, equipped with dual-beam Raytheon DSF-6000N echo sounders, were used to obtain soundings for this survey. See Table I for a list of equipment by vessel and day number. Three skiffs (vessel numbers 2027, 2028, and 2030) equipped with sounding poles were used for shoreline verification. ✓

Table I
Sounding Equipment

RAYTHEON DSF-6000N SERIAL NUMBERS

	LAUNCHES			
Date	2023	2024	2025	2026
133	A113N	A104N	B049	B048N
134-136	A113N	A121N	B049	B048N
278-279	A104N	A113N	B049	B048N
279-299	A104N	A113N	B049	A121N
300-302	A104N	A113N	B049	B048N

Echo-sounding equipment was monitored continuously while on line. All hydrographic data were scanned to insert peaks and deeps between soundings and to ensure proper depth digitization.

No mechanical problems that degraded data quality were encountered with the DSF-6000N echo sounders during this investigation. Bar checks at 3 fathoms were done daily to ensure that the Raytheon DSF-6000N echo sounders were operating properly. Sounding corrections determined for this survey apply to both the high- and low-frequency sounding data.

The high-frequency beam data were digitized except in a limited number of cases. The low-frequency beam data were used when the high-frequency trace was lost due to the steepness of the bottom or suspended particles in the water column. Also, if side echoes were obtained over peaks and reduced line spacing was not needed because of depth (e.g., in 80 fathoms of water), the low-frequency side-echo depth was recorded. This is noted on the raw computer printout with the annotation "low-frequency trace" or "LFT."

Divers' least depths were obtained using a pneumatic depth gauge manufactured by 3-D Instrument, Inc. (s/n 8302079 N). System calibration data can be found in the separate Corrections to Echo Soundings Data package. (Filed with the hydrographic data)

Settlement and squat corrections were determined for all of FAIRWEATHER's survey launches on May 22, 1987, (DN 142) in Womens Bay, Kodiak, Alaska. The results were used to plot settlement and squat curves for each launch. Measurements were conducted in accordance with Section 4.9.4.2 of the Hydrographic Manual. It was determined that there were no applicable settlement and squat corrections for any launch at speeds run while surveying in fathoms. Refer to the Corrections to Echo Soundings Data package for details concerning settlement and squat determinations.
(Filed with the hydrographic data.)

An accurate determination of launch transducer depths was obtained through physical measurement. An oversized carpenter's square was constructed of angle iron, with foot and tenth markings noted on the rise. Divers held the foot of the carpenter's square flush against the transducer while the rise was plumbed using a circular bubble level. On March 27, 1987, a static transducer draft of 0.3 fathoms was recorded for all launches. All launch soundings on the final field sheet were plotted using this TRA value.

Velocity correctors were determined from four SV/D casts in accordance with section 4.9.5.2 of the Hydrographic Manual. Table II shows the dates and locations of the casts. Program VELTAB was used to compute tables from cast data. The results of the last three SV/D casts (17, 18, and 21) were similar enough to average and combine into one table (Velocity Table 2). Table III shows velocity tables determined from cast data. Velocity corrections using a preliminary velocity table (see ~~Appendix IV~~) were applied to all echo-sounder depths plotted on the final field sheets.
(filed with the hydrographic data.)

Table II
Velocity Casts

Cast No.	Date (DN)	Latitude	Longitude
3	136	58/13.8 N	134/58.6 W
17	277	58/16.4 N	135/01.0 W
18	287	58/16.1 N	135/00.0 W
21	302	58/17.6 N	135/04.2 W

Table III
Velocity Tables

Table No.	Based on Casts	Dates
1	3	DN 131-136
2	17,18,21	DN 278-302

SV/D cast numbers 3 and 17 were performed using a Plessy Model 9040 Environmental Profiling System (EPS) (s/n 5647). This instrument was calibrated at the Northwest Regional Calibration Center (NRCC) on March 9, 1987. The remaining casts, 18 and 21, were performed using a Plessy Model 9040 EPS (s/n 5653). This instrument was calibrated at NRCC on September 22, 1987. XBTs and/or surface temperatures were taken during the SV/D casts as a check on the Plessy Systems.

TC/TI tapes were made in accordance with PMC OPORDER, Section 3.5.1. Printouts of TC/TI tapes are included in the ~~appendix of this report~~.
sounding listing folder.

Predicted tide correctors were applied to the soundings plotted on the final field sheets for this survey. The tide correctors used were from the Tide Tables 1987, West Coast of North and South America. Tide correctors use Juneau, Alaska, as the reference station using a height correction range ratio of "x0.96" and no time correction. For further information, refer to ~~Appendix H~~, Field Tide Note. (Filed with the hydrographic data)

E. Hydrographic Sheets

This survey is comprised of four final field sheets (two each, east and west) that are plotted on mylar. In addition, a mylar overlay sheet was constructed. This sheet facilitated the delineation of depth contours and was used to display development lines. The final field sheets were plotted aboard the FAIRWEATHER using a DEC PDP8/e computer and complot plotter.

The final field sheet requirements were modified for survey H-10240. Given the complexity of the shoreline in the survey area, the final field sheet was divided into two parts, plotted on separate sheets. One sheet has sounding lines, least depths from dive investigations and developments, and depth curves. The second sheet has shoreline, along-shore features, descriptive notes, detached positions not on the first sheet, and bottom samples.

All field records ~~will be sent~~ have been transmitted to the NOAA Pacific Marine Center, N/MOP21, for verification and smooth plotting.

F. Control Stations

All horizontal control stations used in this survey were recovered or established by FAIRWEATHER personnel. All geodetic positions were based on the North American Datum of 1927. New stations were located by conventional traverse methods. No anomalies in control, adjustment or closures were encountered. All positions meet or exceed Third-order, Class I specifications. In addition, two aerotriangulation stations were used for this survey. Positions were verified by observing check angles to and from the stations.

Stations used in support of this survey are listed in ~~Appendix V~~, the List of Stations. For additional information, refer to the Horizontal Control Reports, OPR-0186-FA-87, dated April to May and October to November. (station list attached)

G. Hydrographic Position Control

Hydrographic position control was accomplished using the Motorola Mini-Ranger III system except as noted under Section C, Sounding Vessels. The control configuration consisted of range/range and range/azimuth for positioning. Table IV contains a list of console and R/T units for each sounding vessel. Mini-Ranger base-line calibrations (BLCs) were conducted in accordance with PMC OPORDER, Section 3.3.1.1.

Table IV
Mini-Ranger Equipment by Vessel

Vessel Number	Console/RT Number
2020	716/C1875
2023	703/B1108
2024	506042/E2716
2025	716/C1875
2026	B0323/B1398

Beginning BLCs were performed for data collected during the month of May on DNs 75 to 77 along a distance of 990.2 meters between two recoverable marks (Naval Reserve Pier to PMC Pier A) across Lake Union in Seattle, Washington. Ending BLCs were performed on DNs 142 and 146 along a distance of 855.4 meters between two recoverable marks in Womens Bay, Kodiak, Alaska.

Beginning BLCs were performed for data collected during the month of October on DNs 257 to 260 along a distance of 990.2 meters between two recoverable marks (Naval Reserve Pier to PMC Pier A) across Lake Union. Ending BLCs were performed on DNs 321 and 322 at the same location.

Because the differences between beginning and ending BLCs were 5 meters or less, the beginning and ending calibrations were not averaged. The beginning correctors were used as the final correctors. Final base-line correctors and minimum signal strengths can be found in the two Electronic Control Data packages (dated April to May and October to November) submitted for project OPR-0186-FA-87.

Hydrographic positioning equipment was critically system checked at least once per week. Non-critical system checks were conducted once per day unless equipment malfunction prohibited it. All hydrographic positioning equipment was found to be accurate within the limits set forth by PMC OPORDER, Section 3.1.1.2. Critical system checks were accomplished using the theodolite cut method. Theodolites onboard the FAIRWEATHER are as follows: Wild T-1 theodolites with serial numbers 13008, 12932; Wild T-2 theodolites with serial numbers 26336, 85652, 257219, 276503; and Lietz TM1A theodolite with serial number 2151.

In all cases, the launch R/T units were located directly over the transducers, eliminating the need for ANDIST correctors.

H. Shoreline

Shoreline details for this survey are from a 1:10,000-scale mylar enlargement of TP-01311, 1:20,000-scale, and a mylar copy of TP-01312, 1:10,000-scale, Class III, registered shoreline maps. All verified features from the shoreline map are in black ink on the final ~~field~~ smooth sheet; changes are recorded in red ink. New features are displayed in black ink.

~~No~~ Conflicts were found to exist between the shoreline map high water line (HWL) and hydrography. The shoreline map HWL should supersede charted shoreline. changes to the delineation of the HWL on the shoreline map are shown in red on the smooth sheet.

In the course of this survey, many minor changes to shoreline map ledges were noted, several new foul areas were delineated, and many shoreline map rocks were found to be high points (both prominent and non-prominent) on new ledges and reefs. These changes appear to be required as a result of photography for the shoreline maps having been flown at some stage of the tide significantly above mean lower low water (MLLW). These features are adequately delineated on the final field sheet and will not be discussed separately here.

A shoreline map rock at latitude 58/17/16N, longitude 135/03/12W was disproved (see position 3689). A fifteen-minute visual and echo-sounder search was conducted, but failed to uncover any indication of the rock's existence. Water visibility at the time was approximately 5 to 6 feet (the bottom was not visible), and some kelp was found in the area. An echo-sounder depth of 0.9 fathoms was obtained in the rock's reported position. It is recommended that the rock not be charted. concur

A shoreline map rock at latitude 58/17/12N, longitude 135/03/06W was disproved (see position 3534). A fifteen-minute visual and echo-sounder search was conducted, but failed to uncover any indication of the rock's existence. Water visibility at the time was approximately 5 feet (the bottom was not visible). No kelp was found in the area. A lead-line depth of 1.4 fathoms was obtained in the rock's reported position. It is recommended that the rock not be charted. concur

A shoreline map rock at latitude 58/17/20N, longitude 135/03/01W was found after reconnaissance hydrography (5-meter line spacing) was run over the area. The rock, however, was never seen and a lead-line depth was not possible. Surrounding depths ranged from 2.1 to 5.4 fathoms and the echo-sounder least depth of 1.7 fathoms obtained represents a significant feature rising off the bottom. It is recommended that the rock be charted as shown on the final ~~field~~ smooth sheet (see position 6497 04) shown as rky on the smooth sheet.

A shoreline map rock at latitude 58/15/29N, longitude 135/04/44W (reference number 607) was found in an area of boulders, and another rock at latitude 58/17/19N, longitude 135/05/45W (reference number 056) was found on a boulder beach. Both areas were observed at low water. Neither rock is prominent. It is recommended that they not be charted. Do not concur Rocks transferred to the smooth sheet from shoreline map TP-01311. Chart areas as shown on the smooth sheet.

Two shoreline map rocks, located in an area found to be foul with rocks (centered at latitude 58/17/55N, longitude 135/04/05W), were positioned by this survey approximately 15 to 20 meters northwest of their shoreline map positions (see positions 3339 and 3341). The rocks are displayed in red on the final field sheet and should be charted at the new locations. chart as shown on the smooth sheet.

Do not concur

Three shoreline map reefs were found to contain significant islets located at latitude 58/15/56N, longitude 135/04/11W; latitude 58/15/43N, longitude 135/04/04W; and latitude 58/15/02N, longitude 135/03/24W (positions 9200 to 9208). It is recommended that they be charted as located by this survey. They are shown in red on the final field sheet.

concur

The shoreline map reef located at latitude 58/17/08N, longitude 135/03/03W was found to be two separate features. The northern half of the shoreline map reef is a reef (positions 3345 and 3346) while the southern half is a submerged reef which was investigated by divers to obtain limits and least depths (positions 9007 and 9008). Hydrography and divers' visual observations show the two features to be separated by deeper water. Chart as shown on the final ~~field~~ smooth sheet. feature shown as reefs with the lower half as submerged.

Concur

I. Crosslines

A total of 32 nautical miles of crosslines were run on this survey comprising 21 percent of the main-scheme hydrography. Agreement between crossline and main-scheme soundings is within 0.3 fathoms to the 50-fathom depth curve, and within 3 percent at greater depths, except in areas of steep bottom relief. Any disagreement is attributable to irregular or steep bottom contour. There is no systematic problem that would account for differences in these areas.

In some cases, a different vessel was used for crosslines than was used for main scheme. In these instances, equally good agreement was obtained at the crossings, except over irregular or steep bottom contours.

J. Junctions

This survey junctions to the south with survey H-10238 (scale 1:10,000; 1987). No contemporary surveys junction to the north, east, or west with this survey. Agreement between soundings at junctions is good; depths agree within 1 fathom to the 100-fathom depth curve, except in areas of steep relief.

At the southeast corner of the survey, at depths from 100 to 300 fathoms, some junction soundings could not be reconciled by direct comparison. Difficulty in maintaining a high-frequency trace in this area while conducting survey H-10238 resulted in the use of the low-frequency values as the digitized depths. Depths from survey H-10240 used high-frequency values, prohibiting direct comparison by survey sheet overlap. Instead, low-frequency values were manually picked off echogram records in

this area on survey H-10240 and compared to those obtained for survey H-10238. Upon comparison of these low-frequency values, the junction soundings in this area were found to be satisfactory. There is no other systematic problem that would account for difference in this area. The hydrographer recommends a butt junction be considered for this area of the survey. In depths greater than 300 fathoms soundings agree within 1 fathom.

see Sect. 5 of Eval. Report

K. Comparison with Prior Surveys

The following prior surveys are applicable to the area covered by this survey:

Survey	Year	Scale
H-2055	1890	1:40,000 and 1:80,000
H-4228 (wire drag)	1922	1:40,000
T-3987	1922	1:20,000

see Sect. 6 of Eval. Report

Shoreline map T-3987 was not provided to the hydrographer and therefore will only be discussed as far as it contributed to non-sounding features on the chart in Section L, Comparison with the Chart. No prior survey was identified or supplied to the ship that contains the charted soundings east of Point Howard and north of latitude 58/16/45N or that contains a 70-fathom sounding at latitude 58/16/41N, longitude 135/03/43W. These charted soundings also will be discussed in Section L.

These soundings are from survey H-2056

Comparison of depths obtained by this survey with those of survey H-2055 was accomplished by matching shoreline features, as correlating latitudes and longitudes resulted in poor agreement between both shoreline features and prior survey soundings.

Most depths from prior survey H-2055 may be found within approximately 50 meters of comparable depths obtained by this survey, and generally no more than 150 meters away. Given the date, scale and nature of this survey, agreement is generally good. There are some exceptions.

The prior survey indicates a depth of 13 fathoms at latitude 58/17/17N, longitude 135/03/30W. Hydrography over this area (45-meter line spacing) indicates depths ranging from 40 to 50 fathoms. It is recommended that survey H-10240 depths supersede the 13-fathom depth.

Concur

Depths of 71 fathoms at latitude 58/17/06N, longitude 135/02/25W and 124 fathoms at latitude 58/17/05N, longitude 135/02/35W are indicated on the prior survey. The present survey found depths of 8 to 13 fathoms (45-meter line spacing) and 30 to 70 fathoms (45- to 90-meter line spacing), respectively, at these locations. A steep bottom contour exists in this vicinity; therefore, any error in the positioning of prior survey soundings would result in a drastically different comparison. It is recommended that these prior survey depths be superseded by the present survey.

concur

A depth of 25 fathoms from survey H-2055 is indicated at latitude 58/17/08N, longitude 135/04/44W. Hydrography (90-meter line spacing) revealed 35-fathom depths with the nearest comparable depth approximately 350 meters to the west. The hydrographer can offer no explaination for the discrepancy consistant with the apparent accuracy of other nearby prior survey depths. Given that the regular nature of the bottom in the area gives no indication of a 25-fathom peak, it is recommended that present survey depths supersede the 25-fathom depth.

concur

A depth of 254 fathoms from survey H-2055 at latitude 58/16/17N, longitude 135/02/15W was disproved using 180-meter line spacing. Hydrography revealed 166 fathoms in the area with the nearest comparible depth approximately 250 meters to the east. A steep bottom contour exists in the area, and could account for the discrepancy.

As a result of the denser line spacing accomplished for this survey, numerous point features not shown on the prior survey were found. Least depths (determined by divers or lead line) or elevations, descriptions, and positions for these features can be found in ~~Appendix IX~~, Dangers to Navigation (Report, copy to the Coast Guard attached).

No significant shoaling trends were observed by the hydrographer. It should be noted that soundings on the prior survey are sparse; H-10240 should supersede the prior survey in all common areas.

concur

Features from prior surveys were compared by the same method described above for comparison of prior survey soundings.

A reef from survey H-2055 at latitude 58/16/01N, longitude 135/04/15W was disproved using 45- and 90-meter line spacing. No reef was found and depths in the area ranged from 24 to 36 fathoms. It is recommended that this feature be deleted from the chart.

concur

A reef south of Point Howard from survey H-2055 at latitude 58/17/14N, longitude 135/03/06W was not found at the prior survey location. At low water, no reef was visible. Depths in the area ranged from 2 to 8 fathoms. An uncharted reef uncovered 7 feet at MLLW and a submerged reef in close proximity in the vicinity of latitude 58/17/08N, longitude 135/03/03W were located approximately 200 meters south of the reef from survey H-2055 . It is recommended that the charted reef be moved to the position obtained by this survey. The new location of the reef was reported as a danger to navigation to the Seventeenth Coast Guard District ~~(see Appendix IX)~~.

concur

(copy of report attached)

Two rocks from survey H-4228 (wire drag) charted in the vicinity of latitude 58/17/39N, longitude 135/02/51W were found to be an extension of a ledge running east at approximately right angles to the shoreline. This ledge was adequately displayed on the shoreline map, and can be seen on the final field sheet. ✓

L. Comparison with the Chart

This survey was compared to a 1:10,000-scale enlargement of Chart 17316, 14th Edition, October 1982, 1:80,000.

Comparison of survey H-10240 with the chart was made by matching shoreline features; matching of latitude and longitude scales resulted in generally poor agreement between shoreline and sounding features. The soundings from the chart discussed include only those east of Point Howard and north of latitude 58/16/45N, and the 70-fathom sounding at latitude 58/16/41N, longitude 135/03/43W. All other charted soundings originate from prior surveys previously discussed in Section K, Comparison with Prior Surveys. ✓

Charted depths, with the exception of one, may be found within one-hundred meters of comparable depths obtained by this survey. Given the scale of the chart and the generally deep depths being compared, agreement is good. ✓

The one discrepancy noted above concerns a 357-fathom depth reported at latitude 58/20/00N, longitude 135/00/13W. Survey soundings indicate a depth of 257 fathoms in this location. This discrepancy could not be reconciled with certainty by the hydrographer since no prior survey was available for direct comparison. One possible explaination is that a 257-fathom sounding was transferred incorrectly as a 357-fathom sounding to the chart; a possibility given credence by indications on the chart markup that a 359-fathom sounding charted at latitude 58/18/59N, longitude 135/00/44W should read 319 fathoms (a depth which agrees well with soundings from this survey). Present survey depths should supersede the 357-fathom sounding on the chart. ✓ concur

Two charted rocks in the vicinity of latitude 58/16/38N, longitude 135/05/13W and latitude 58/16/41N, longitude 135/05/17W from survey T-3987 were found to be two reefs with an intervening area foul with rocks. It is recommended that the area be charted as shown on the final ~~field~~ smooth sheet (positions 6059 to 6067). ✓ concur

A group of three charted rocks in the vicinity of latitude 58/16/00N, longitude 135/04/43W from survey T-3987 was found to be an extensive area of ledge, with one small islet near its southern end. It is recommended that these rocks be removed from the chart, and a ledge and islet be added as shown on the final ~~field~~ smooth sheet. ✓ concur

Two charted rocks in the vicinity of latitude 58/15/00N, longitude 135/03/23W from survey T-3987 were found to be ledge around an islet (positions 9200 to 9202). Station LIST 2, 1922 (station number 102) is located on this islet. It is recommended that the rocks be changed to an islet and ledge as shown on the final ~~field~~ smooth sheet. ✓ concur

A charted ledge at latitude 58/16/32N, longitude 135/05/21W was not found, nor was any indication of its existence given on the shoreline map. During shoreline verification, an area foul with rocks (positions 5013 to 5015) was found at the charted ledge's southern limit and a small area of ledge (positions 1434 and 1435) was found near its northern limit. Both new features' limits are delineated on the final ~~field~~ smooth sheet. It is recommended that the ledge be deleted from the chart. concur

Three uncharted ledges were found adjacent to the mouth of the river northwest of Point Howard. These ledges were reported as dangers to navigation. See the final ~~field~~ smooth sheet for delineation.

Numerous charted offshore rocks in the vicinity of latitude 58/16/15N, longitude 135/05/15W were found by this survey to be reefs. Limits were determined by detached positions and lines of hydrography (see final ~~field~~ smooth sheet).

Except for those features discussed above in this section and under Section K, Comparison with Prior Surveys, all other charted features were found. Many features were found to be more extensive than indicated on the chart and are shown on the final ~~field~~ smooth sheet.

Thirteen dangers to navigation were noted during this survey. Lists of these dangers including description, latitude and longitude, and position number, may be found in the letters addressed to the Commander (oan) of the Seventeenth Coast Guard District. A copy of each letter ~~included in Appendix IX~~, Dangers to Navigation, is attached.

Divers' least depths over shoal areas discovered during the course of the survey were determined using a pneumatic gauge.

M. Adequacy of Survey

This survey is sufficiently complete and adequate to supersede the prior surveys in their common area. No additional field work is necessary. concur

N. Aids to Navigation

There are no aids to navigation or landmarks located within the limits of this survey.

O. Statistics

Vessel	2020	2023	2024	2025	2026	2030	Total
Positions	10	778	931	69	975	9	2436 ~~2772~~
Nautical Miles	-	61	99	-	72	-	232
Square Miles	-	-	-	-	-	-	13
Bottom Samples	10	-	-	35	-	-	45
Velocity Casts	4	-	-	-	-	-	4
Tide Stations	1	-	-	-	-	-	1
Days of Production (Hydrography only)	-	-	-	-	-	-	13

No magnetic or current stations were established during this survey.

P. Miscellaneous

No unusual submarine features or anomalous tidal conditions were observed during this survey. No current observations were made.

Kelp was found fringing the shoreline in Lynn Canal north of Point Howard (see final field sheet).

Bottom samples were collected and forwarded to the Smithsonian Institution, Washington, D.C..

Q. Recommendations

None.

R. Automated Data Processing

The following programs were used for data acquisition or processing.

Number	Program Name	Version Date
RK 112	Range-Range Real Time Plot	04/23/84
RK 116	Range-Azimuth Real Time Plot	03/01/86
RK 201	Grid, Signal and Lattice Plot	04/18/75
RK 221	Range-Range Non-Real Time Plot	07/25/86
RK 226	Range-Azimuth Non-Real Time Plot	07/25/86
RK 300	Utility Computations	10/21/80
RK 330	Reformat and Data Checker	05/04/76

FROM: N/MOP21 - Thomas W. Richards

SUBJECT: Geographic Name, Howard Bay

I was recently visited by Capt. E.W. Richards (NOAA retired). He is presently operating a salmon hatchery in Skagway, Alaska. For approximately the past 5 to 10 years he has been obtaining salmon eggs for his hatchery in a bay immediately south and west of Howard Point in Lynn Canal, Alaska. The approximate position of this bay is latitude 58°18'N and longitude 135°04'W (see Attachment "A"). He indicated to me that this bay is known to local fishermen and pleasure boaters as Howard Bay.

When I was in Skagway last fall, I also heard this bay referred to as Howard Bay by a number of local fishermen. I recommend that Board of Geographic Names consider naming this bay, Howard Bay.

Dear Sir:

This letter confirms my radio message P 081830 NOV 87 (copy enclosed).

The following statement is recommended for inclusion in the Local Notice to Mariners:

The following uncharted dangers to navigation were found by NOAA Ship FAIRWEATHER during hydrographic survey operations (survey H-10240) in the vicinity of Point Howard, Lynn Canal, Alaska. All items are on chart 17316. Depths are referenced to mean lower low water (MLLW) based on predicted tides. Positions are based on the North American Datum of 1927 (NAD 27). Bearings are degrees true and distances are in nautical miles from Swanson Harbor Entrance Light 2 (LLNR 24130).

H-10240

1. INTRODUCTION

Survey H-10240 is a basic hydrographic survey accomplished by the NOAA Ship FAIRWEATHER under the following Project Instructions.

OPR-0186-FA-87, dated July 29, 1986

CHANGE NO. 1, dated August 4, 1986
CHANGE NO. 2, dated December 24, 1986
CHANGE NO. 3, dated February 2, 1987
CHANGE NO. 4, dated March 17, 1987
CHANGE NO. 5, dated April 13, 1987
CHANGE NO. 6, dated April 29, 1987
CHANGE NO. 7, dated July 28, 1987

This survey occurred in Alaska on the west side of Lynn Canal in the vicinity of Howard Bay and Point Howard. The surveyed area extends from latitude 58°14'48"N to latitude 58°20'00"N and from longitude 135°00'00"W to longitude 135°06'21"W. The bottom consists extensively of mud and some pebbles, stone, gravel and sand. Depths range from 0 to 360 fathoms.

Predicted tides for Juneau, Alaska were used for the reduction of soundings during field processing. Approved hourly heights zoned from Swanson Harbor, gage 945-2368, were used during office processing.

The field sheet parameters have been revised to center the hydrography on the smooth sheet and to change the projection to polyconic. TRA, velocity correctors and electronic control correctors are adequate and required no revision. Settlement and squat correctors were properly determined and no corrections were required for any sounding vessel. An accompanying computer printout contains the parameters and the correctors.

A digital file, generated for this survey, includes categories of information required to comply with N/CG2 Hydrographic Survey Guideline No. 23, Completion of Digital Hydrographic Surveys, September 7, 1983. Certain descriptive information, however, may not be in the digital record because of the restrictions of the available cartographic codes. The user should refer to the smooth sheet for complete information.

2. CONTROL AND SHORELINE

Sections F and G of the hydrographer's report and the Horizontal and Electronic Control Reports for OPR-0186-FA-87 contain adequate discussions of horizontal control and hydrographic positioning.

Positions of horizontal control stations used during hydrography are 1922 published values and a 1987 field value based on NAD 27. These values were used during office processing for the computation of positions. The smooth sheet and accompanying overlays are annotated with NAD 83 adjustment ticks

based on values determined by N/CG121. Geographic positions based on NAD 83 may be plotted on the smooth sheet using the NAD 27 projection by applying the following corrections:

latitude: +1.211 seconds (37.5 meters)
longitude: -6.489 seconds (-105.7 meters)

The year of establishment of control stations shown on the smooth sheet originates with published information and the 1987 field data. The 1987 field positions are subject to change pending certification of the data by NGS.

There are 18 weak fixes (angles of intersection less than 30 degrees or more than 150 degrees) noted in this survey. However, there are no significant plotting differences between the soundings located by these fixes and those in adjacent areas. Also, none of these fixes are used to position dangers to navigation. Two nearshore rocks at latitude 58°16'27.41"N, longitude 135°05'17.53"W and at latitude 58°15'46.94"N, longitude 135°04'44.95"W were among these positions. These fixes are considered acceptable.

The following shoreline maps apply to this survey.

	Photo Date	Class
TP-01311	May, June, July 1985	III
TP-01312	May, June 1985	III

Changes to the high water line depicted on the shoreline maps, centered at the positions listed below, are shown in red on the smooth sheet.

Latitude (N)	Longitude (W)
58°15'56"	135°04'11"
58°15'43"	135°04'03"
58°15'38"	135°04'28"
58°15'02"	135°03'23"

Many nearshore rocks shown as awash on shoreline map TP-01311 north of Point Howard are not high points of extensive ledges. These rocks, which are part of the ledges, are not shown on the smooth sheet. Other rocks and features shown on the shoreline maps that were verified were transferred to the smooth sheet. Elevations of some rocks were determined during this survey and are shown on the smooth sheet.

A rock shown as awash on shoreline map TP-01311 at latitude 58°14'54"N, longitude 135°05'49"W was found to be an islet 3 feet above MHW. Two additional rocks, also shown as awash on shoreline map TP-01312 at latitude 58°15'56"N, longitude 135°04'35"W and at latitude 58°15'58"N, longitude 135°04'34"N were found to be islets, both 6 feet above MHW.

3. HYDROGRAPHY

Hydrography is adequate to:

a. delineate the bottom configuration, determine least depths, and draw the standard depth curves;

b. reveal there are no significant discrepancies or anomalies requiring further investigation; and

c. show the survey was properly controlled and soundings are correctly plotted.

4. CONDITION OF SURVEY

The hydrographic records and reports received for processing are adequate and conform to the requirements of the Hydrographic Manual, Fourth Edition, revised through CHANGE NO. 3; the Hydrographic Survey Guidelines; and the PMC OPORDER.

5. JUNCTIONS

Survey H-10240 junctions with the following survey.

Survey	Year	Scale	Area
H-10238	1987	1:10,000	South

The junction with survey H-10238 has not been formally completed since that survey was previously processed and forwarded for charting. The junction comparison was made using a copy. The discrepancies noted by the hydrographers in section J of surveys H-10240 and H-10238 Descriptive Reports were resolved during the processing of survey H-10238. Soundings and depth curves are in good agreement. Two soundings to better portray the bottom and ledge delineations have been transferred to the present survey.

6. COMPARISON WITH PRIOR SURVEYS

H-2055 (1890) 1:40,000 and 1:80,000
H-2056 (1890) 1:40,000

Taking into consideration the differences in the scales of the surveys, the methods of surveying and the datum adjustments, comparison with prior surveys H-2055 and H-2056 is satisfactory.

Survey H-10240 is adequate to supersede these prior surveys within the common area.

H-4228 WD (1922) 1:40,000

Wire drag survey H-4228 covers most of the eastern portion of the survey area, an area of deeper depths. The comparison indicates no conflicts with contemporary data.

T-3987 (1922) 1:20,000

This prior survey is not listed in the Project Instructions for comparison, however, several charted rocks originate from this survey necessitating a comparison to effect an appropriate supersession. The comparison indicates that all features are supported by contemporary data from survey H-10240 and accordingly are superseded.

There are no AWOIS items originating from the prior surveys applicable to the present survey.

7. COMPARISON WITH CHART

Chart 17316, 14th Edition, dated October 30, 1982; scale 1:80,000
Chart 17316, 15th Edition, dated August 29, 1987; scale 1:80,000
Chart 17300, 4th Edition, dated June 15, 1985; scale 1:209,978

a. Hydrography

All charted information originates with surveys H-2055 and H-2056 and miscellaneous sources. Survey H-10240 is adequate to supersede charted hydrography within the common area.

b. AWOIS

There are no AWOIS items originating from miscellaneous sources applicable to this survey.

c. Controlling Depths

There are no charted channels with controlling depths within the area of this survey.

d. Aids to Navigation

There are no fixed or floating aids located within the area of this survey.

e. Geographic Names

Names appearing on the smooth sheet and in the survey title have been approved by the Chief Geographer.

f. Dangers to Navigation

The hydrographer reported uncharted rocks, reefs and ledges to the USCG in two separate letters. Copies of the reports are attached.

No dangers were reported during office processing.

8. COMPLIANCE WITH INSTRUCTIONS

Survey H-10240 adequately complies with the Project Instructions.

9. ADDITIONAL FIELD WORK

This is a good hydrographic survey. No additional field work is recommended.

Arsenio A. Luceno
Cartographer

This survey has been examined and it meets Charting and Geodetic Services' standards and requirements for use in nautical charting. Approval is recommended.

Dennis Hill
Chief, Hydrographic Section

APPROVALS

I have reviewed the smooth sheet, accompanying data, and reports associated with hydrographic survey H-10240. This survey meets or exceeds Charting and Geodetic Services' standards for products in support of nautical charting.

Chief, Nautical Chart Branch (Date)

After review of the smooth sheet and accompanying reports, I hereby certify this survey is accurate, complete, and meets appropriate standards.

INSTRUCTIONS

A basic hydrographic or topographic survey supersedes all information of like nature on the uncorrected chart.
1. Letter all information.
2. In "Remarks" column cross out words that do not apply.
3. Give reasons for deviations, if any, from recommendations made under "Comparison with Charts" in the Review.
