

Predicted tides, MLLW datum, were applied to all soundings using the reference station and correctors designated in the project instructions. The tides were then incorporated in the Comflex data files onboard the vessel and used during data acquisition. Unverified water level correctors were determined from the gauges maintained by AHP-2 and compared to the predicted correctors to identify periods when actual and predicted tides were not in agreement. These differences were monitored and used to determine if sounding disagreements were due to tidal prediction errors. *Approved tides were applied to the present survey during office processing.*

Approved water levels were requested from the Sea and Lake Levels Branch in a letter dated August 07, 1990. A copy of the letter is included in *\*Appendices IV.\** *Filed with the original survey records*
