

The final field sheet was plotted using predicted tides determined from Port O'Connor, Texas and correctors designated in zone "I" from section 5.9 of the project instructions. The values were applied direct in accordance with these instructions. It was noted that wind conditions during this survey (i.e., speed and direction), had a notable effect on the true water levels. These weather factors resulted in high water levels on down-wind shores and low water levels on lee shores.

Approved water levels were requested from the Sea and Lake Levels Branch, N/OMA12, in a letter dated 20 December, 1991. A copy is included in Appendix V.*
