Descriptive Report to Accompany Hydrographic Survey H-10587

Field Number PHP-5-2-94
Scale 1:5,000
1994

Pacific Hydrographic Party
Chief of Party: LT Richard A. Fletcher

A. PROJECT ✓

A basic hydrographic survey was accomplished in accordance with project instructions OPR-N251-PHP Port Angeles, Washington dated May 17, 1994. An amendment to these project instructions was submitted from Nautical Charting Division on August 5, 1994.

This survey (H-10587) responds to requests from the Puget Sound Pilot Association, the Port of Port Angeles, the City of Port Angeles, and local commercial enterprises. The primary concern is to update charted hydrography, which dates from 1892 to 1974, to resolve discrepancies between charted and existing cultural features, and to investigate wrecks and submerged features. The Port of Port Angeles is frequently used by large vessels for refueling, awaiting orders or tugs, and a harbor of refuge when weatherbound. Commercial activities include oil handling and bunkering, liquid bulk handling (caustic soda, chlorine, etc.), dry bulk handling (logs, lumber, wood chips, pulp, limestone, etc.), and general cargo handling that includes seafood. A ferry service is also available between Port Angeles and Victoria, B.C. The Port Angeles Boat Haven accommodates commercial fishing vessels and pleasure craft with approximately 500 berths.

This survey's sheet letter is "A". The field sheet was divided into two plots, due to equipment constraints, HDAPS tables # 9 & # 10. This sheet is the fourth survey for project OPR-N251-PHP.

B. AREA SURVEYED ✓ See Eval Report, Section B

The area surveyed for H-10587 extends from latitude 48°06'50" N, north to latitude 48°08'50" N, and from longitude 123°22'16"W west to longitude 123°29'55"W. Hydrography for H-10587 are within the limits required by the Hydrographic Manual (Section 1.2.3), and the project instructions. Data acquisition began December 20, 1994 (DN 354) and continued through to May 22, 1995 (DN 142).

C. SOUNDING VESSELS

NOAA VN 1101 (EDP No. 0651), a 29-foot Jensen, and NOAA VN 1102 (EDP No. 0652), a 21-foot SeaArk, were used for all hydrography and velocity casts. There was no change to the standard vessel configuration for VN 1101.

The antenna on VN 1102 was relocated on 1/6/95 resulting in a change of offset tables. The following offset tables were applied to data collected with VN 1102:

Offset Table	Day Numbers
2	354-005
3	006-142

D. AUTOMATED DATA ACQUISITION AND PROCESSING

The PC-Data Acquisition System (PC-DAS) and the Hydrographic Data Acquisition and Processing System (HDAPS) software were used during this survey. Program names and versions are listed in the appendix.

The following non-HDAPS computer programs were used:

Program Name	Date	Version
PC-DAS	1994	5.00
VELOCITY	1994	2.11
NADCON	1989	1.01
MONITOR	1994	2.00
GEOID93	1993	1.00
SMLGAUGE	1994	2.20
DAILYDQA	1994	2.20

Raw data files were collected on plotter sheet 34 (1:10,000). Data were plotted on sheets 9 (1:5,000), 10 (1:5,000), and 36 (1:10,000).

E. SONAR EQUIPMENT

Side scan sonar (SSS) operations were conducted using an EG&G model 260 slant-range corrected SSS Recorder and an EG&G 272-T dual-channel (single frequency) towfish. The towfish was operated on the 100 kHz frequency and was configured with a 10° beam depression.

The following sonar equipment was used throughout the survey:

Type	S/N
Towfish	015598
260 Recorder	015602

The SSS towfish was towed with a 43 meter EG&G lightweight towcable. The towfish was deployed with an electric winch through a block mounted to a swing-arm davit on the starboard quarter of launch 1101. The length of towcable deployed was determined by measured markings on the towfish cable. The SSS towfish was maintained at a height off the bottom of 8 to 20 percent of the range scale. The measured towpoint is found in the offset tables*. Five range scales were used 50-,75-, 100-, 150-, and 200-meters. SSS operations were conducted at or less than the maximum speed of five knots while operating with the 50-, 75-, or 100-meter range scales and four knots while operating with the 150- and 200-meter range scale.

The inshore limit of SSS collection was the 5-meter curve, safe navigation with a SSS towfish, or the limit of collecting acceptable SSS sonargrams. Obtaining acceptable SSS sonargrams was exceptionally difficult in shallow sloping areas less than five fathoms (10 meters) due to jet wash, currents, kelp, and thermal gradients in shallow water. The recorder gain setting was set for the best return for the most prevalent bottom material. Contacts or identifiable features, such as a change in bottom texture, moored vessels, or pipelines were seen in the outer portion of the usable SSS sonargram and are an indication of proper SSS recorder tuning and were periodically marked as confidence checks. Degraded sonargrams were rejected and rerun, or the acceptable swath width was adjusted. Two 1:10,000 scale swath plots depicting adjusted SSS bottom coverage indicate that 200% SSS coverage was completed. Check of coverage plots seems to indicate that the requirement of 200% Side Scan was met. However, refer to Section P. Atrocity where the hydrographer has specified an area which is not in compliance with the line spacing required for a 1:10,000 scale survey. Side scan sonargrams were manually scanned for significant contacts in accordance with section 7.3.2 of the project instructions and entered into HDAPS contact tables*. In areas of numerous contacts only the highest contacts were entered. PHP entered 650 contacts into 41 contact tables* in confile 1.

PHP used the sifter program to help determine which contacts appeared to be significant and needed further investigation. A 50-meter radius and threshold depth of 19-meters was utilized March 9, to sift and identify significant contacts. The sifter printout was manually scanned for the largest contacts to development. On March 30 the contacts were resifted using a

* Filed with the hydrographic data

100-meter radius and threshold depth of 19-meters to more easily identify the most significant contacts. All SSS contacts flagged as significant were investigated. Then contacts were resifted using a 50-meter radius and threshold depth of 19-meters. All SSS contacts flagged as significant were investigated. A sifter program printout, run upon completion of investigations, with annotations as to the disposition of contacts remaining flagged, and the contact table listing are included in Separate V* of this report.

During near shore SSS operations a buoy was connected to the towfish towpoint to maintain the required height off the bottom and keep the towfish out of the jet wash.

PHP had difficulty acquiring SSS data within the harbor due to log booming operations and many log storage areas. SSS operations were delayed numerous times to affect towfish and towcable repairs. On DN 046 a new cable was installed and marked.

F. SOUNDING EQUIPMENT ✓

The following sounding equipment was used throughout this survey:

Vessel #	Model	Serial #	Day #'s
1101	DSF-6000N	A121N	026-097
1102	IN-448	236	354-142

Digitized soundings displayed on line were compared in the field with the analog trace to ensure reasonable agreement. No on-line calibration adjustments can be performed on the IN-448 or DSF-6000N.

Soundings were recorded in meters with an assumed speed-of-sound through water of 1500 m/sec. Depths encountered in the survey area ranged from -1.2 meters (fix number 98) to 86.1 meters (fix number 5050) based on ~~predicted~~ approved tides.

Metric lead lines were used for depth comparisons with the echosounder. PHP fabricated the lead lines following Hydrographic Survey Guideline (HSG) 69. Each lead line is 1/4-inch steering tiller rope. Shrink tubing, secured with "Scotchkote", marks one-meter intervals from 1 to 30. With the line subjected to six pounds of constant tension, markings were calibrated with a steel surveyor's tape. The throwing end is a standard six-pound lead weight shackled to a stainless steel

* Filed with the hydrographic data.

thimble bent to the bitter end. Leadline calibration forms are included in Separate IV* of this Descriptive Report.

The IN-448 had extreme difficulty tracking and correctly digitizing in the deeper steep sloping portions of this sheet. PHP attributes this difficulty to the turbulence and debris in the water column aggravated by inadequate grounding of electronics on VN 1102. Data was analyzed during office processing and found to contain no significant problems.
The DSF-6000N performed well during the course of this survey except when hydrography was run in depths shoaler than the reverb blanking setting. This resulted in a false return of the bottom. When this occurred the data were rejected and rerun. See statement above.

When the DSF 6000N high frequency did not digitize correctly, the low frequency depth, when available, was manually inserted into the digital record. Data was analyzed during office processing and found to contain no significant problems.
The hydrographer does not consider occasional breaks in the continuity of the echogram significant unless greater than 6 mm at survey scale (Section 1.4.6, Hydrographic Manual), or if they occurred over a shoaling trend (potential missed peak), in which cases the section or line was resurveyed.

A MOD III Divers Least Depth Gauge was used on DN 59. The gauge was operated in accordance with section 7.2.2.1 of the Field Procedures Manual with the exception that no AML cast was performed on the day the gauge was operated. Instead the previous AML cast number 17, DN 045, was utilized.

G. CORRECTIONS TO SOUNDINGS ✓

Velocity of Sound

Corrections for the speed of sound through the water column were computed from data obtained with an Applied Microsystems Laboratories (AML) Velocity of Sound Profiler, S/N 3042. VELOCITY was used to determine sounding correctors which were applied to all high and low frequency soundings.

* Filed with the hydrographic data.

The following casts were used: ✓

Cast	Extrapolated DN	Depth	DN Range	HDAPS Tables	Cast Position Latitude	Longitude
13	354	151.8	354-004	13	48°09'40"N	123°28'20"W
14	005	160.2	005-016	14	48°09'42"N	123°28'18"W
15	017	121.7	017-031	15	48°10'00"N	123°25'00"W
16	031	107.1	032-044	16	48°10'00"N	123°25'00"W
17	045	109.8	045-078	17	48°08'44"N	123°24'56"W
18	079	83.3	079-142	18	48°08'45"N	123°24'00"W

Separate IV* contains copies of all velocity cast data and HDAPS Velocity Corrector Tables. Casts 13, 14, 15, and 16 plot outside the survey limits.

The AML instrument(S/N 3042) was calibrated by Northwest Regional Calibration Center on April 15, 1994(DN 105). A copy of this calibration report is included in Separate IV* of this Descriptive Report.

On DN 142 additional development hydrography was obtained in shallow water (less than 8 meters). A velocity cast was not performed and velocity cast number 18, DN 079, was applied to the raw data. Data was analyzed during office processing and found to contain no significant problems.

Lead line Comparisons ✓

Lead line comparisons were periodically conducted to confirm proper digitization of echosounder depths. These are annotated on the echograms.*

Static Draft ✓

Static draft for VN 1102 was determined on 4/12/94. First, the depth of the transducer face from a reference mark on the hull was measured. Next, with the launch in the water, fuel tanks half full and two crewmen aboard, the depth from this reference mark to the launch's waterline was measured. Combining the two measurements, a static draft of 0.4 meters was calculated.

A static draft of 0.5 meters was determined for VN 1101 on 5/3/94, using a method similar to the one above. Static draft for VN 1101 was redetermined on March 20, 1995(DN 079) after major repairs, a static draft of 0.5 meters was calculated.

Supporting data are included in Separate IV.*

* Filed with the hydrographic data.

Dynamic Draft ✓

Settlement and squat correctors are applied on line to all survey data. Settlement and squat correctors are reapplied during field processing using the REAPPLY program in HDAPS.

VN 1101 settlement and squat measurements conducted on 5/4/94 were applied using Offset Table 1* (DN 354-078) and measurements conducted on 3/20/95 were applied using Offset Table 4* (DN 079-097).

VN 1102 settlement and squat measurements conducted on 5/5/94 * were applied throughout the survey using Offset Tables 2 and 3. Supporting field records are included in Separate IV* of this Descriptive Report.

Tide Correctors ✓

In compliance with Section 5.9 of the Project Instructions, predicted tide correctors from the existing Primary station at Port Angeles, 944-4090, were applied to soundings during field processing. One tidal zone was established for this survey. Final correctors will be applied from data collected by this station. All times and heights for this tidal zone were direct. *Tide Note dated June 20, 1995 is attached to this report.*

H. CONTROL STATIONS See Eval Rpt, Section H

Horizontal Datum

The horizontal datum for this project is North American Datum of 1983 (NAD 83). A copy of the HDAPS Control Station Table is included in Appendix III* (List of Horizontal Control Stations). A separate Horizontal Control Report OPR-N251-PHP, Port Angeles, was submitted to PHS in September of 1994.
HDAPS control station table is attached to this report.

A DGPS fixed point performance station was positioned at the USCG pier to third order class 1 standards.

I. HYDROGRAPHIC POSITION CONTROL See Eval Rpt, Section I.

* *Filed with the hydrographic data.*

Position Control ✓

Differential GPS (DGPS) was used for position control throughout this survey. The following beacons were used during hydrographic operations:

Location	Frequency
Race Rocks, Victoria, B.C.	309 kHz
Pt. Atkinson, Vancouver, B.C.	320 kHz
Robinson Point, Maury Is., WA	323 kHz

MONITOR results for these three stations are found in Separate III.*

The accuracy requirements as stated in section 3.4 of the Field Procedures Manual were met during the course of this survey with the exception of the buffer line on the south shore of the harbor. High HDOP's were encountered on the buffer line due to the high bluff to the south which blocked part of the GPS horizon. The track plot was checked and if the track plot represented the course actually run the data were retained. Data was analyzed during office processing and found to contain no significant problems. Occasional signal loss was encountered due to extreme atmospheric conditions. See statement above.

GPS Performance Checks ✓

DGPS performance checks using the fixed point method were obtained per FPM Section 3.4.4.1, using the site established at the USCG pier at Ediz Hook, Port Angeles. Performance check forms are included with the data files.

Positioning Equipment ✓

The unique numbers for all equipment serial numbers are annotated on the daily echograms.* The GPS antenna on VN 1102 was relocated on January 6, 1995. Offset Table 2 was used from DN 354 to DN 005 and Offset Table 3 was used from DN 006 to DN 142. Antenna offsets for each vessel are listed in the corresponding offset tables. Supporting data is included in Separate III.*

J. SHORELINE See Eval Rpt, Section J.

DM-10158 is the source document for shoreline on this survey and was supplied in both mylar and digital form. The digital map (DM) is plotted on all hydrographic field sheets for reference.

* Filed with the hydrographic data.

In addition to the source shoreline two 1:20,000 DM markups, with notes to the hydrographer, were forwarded with the project instructions.

The entire harbor area has seen extensive changes to cultural features along the shoreline. Because DM-10158 was compiled at a scale of 1:20,000 and the survey scale was 1:5,000 PHP found extensive changes to the source document. Rather than describe each item in the Descriptive Report the following graphical (color code) approach was taken:

> Two 1:5,000 field plots of the digital shoreline were made. The following color code was used to print comments on the shoreline plot to differentiate additions to the shoreline, digital map disprovals, prior survey disprovals, and chart disprovals:
>
> Red- All additions to the digital shoreline
> Green- Digital shoreline disprovals
> Violet- Prior survey disprovals
> Blue- Chart disprovals

The following items could not be adequately depicted on the shoreline field plot and require additional explanation:

> Several dolphins plotted on the DM were covered with SSS coverage during the course of this survey. Dolphins at the following positions were disproved with SSS and should not be charted: *concur*

Latitude	Longitude	SSS FIX
48°07'32.55"N	123°26'~~54.00~~ 39.00"W Rec	5483-5484,5819-5821
48°07'25.65"N	123°26'14.85"W	5894-5895
48°07'22.50"N	123°26'05.55"W	5541-5542
48°07'16.50"N	123°25'32.00"W	5865-5868
48°07'13.50"N	123°25'32.00"W	5225-5226, 5576-5577
48°07'13.00"N	123°25'32.00"W	5225-5226, 5576-5577
48°07'12.50"N	123°25'32.00"W	5225-5226, 5576-5577

The privately maintained light (LL # 16310, Volume VI, 1993) is incorrectly charted. The light is mounted on the eastern-most dolphin (Fix number 6193 and check Fix number 6581) off the Port of Port Angeles pier. These changes are shown on the ~~field shoreline~~ smooth sheet plot. Port Dock Light as located by this survey plots at latitude 48°07'32.543 N, longitude 123° 26' 12.484 W.

PHP observed the removal of two dolphins plotted on the DM at latitude 48°08'22.20"N, longitude 123°24'44.85"W, during the construction of the wave abatment system at the USCG station. Do not chart per digital map. *concur*

Two dolphins on the south shoreline at latitude 48°06'59.55"N longitude 123°24'50.55"W and latitude 48°06'59.10"N 123°24'47.25"W were visually investigated. No evidence of dolphins were seen. Do not chart per digital map. *concur*

A dolphin plotted on the DM at latitude 48°08'22.76"N longitude 123°24'55.45"W (Fix 6323) is a mooring buoy. Chart a mooring buoy. *concur*

The Notes to Hydrographer references a light with no ID at the eastern end of Ediz Hook, latitude 48°08'24.00"N, longitude 123°24'09.00"W. There is no light at this position. There is a building which houses a fog signal. This fog signal is referenced in the Light List, Volume VI, 1993 under # 16280, Column 8. *concur* Retain fog signal as presently charted.

K. CROSSLINES ✓

SSS lines were run perpendicular to the mainscheme hydrography and were used for crossline comparison. Nautical miles of crossline total 131.24 nm, representing 45.0% of the mainscheme hydrography on H-10587. There was good agreement between the mainscheme and crossline hydrography. *concur*

L. JUNCTIONS *See Eval Report Section L*

The west, north, and east edges of H-10587 (1:5,000) adjoins contemporary survey H-10583 (1:10,000). Comparison between the two showed good agreement.

M. COMPARISON WITH PRIOR SURVEYS *See Eval Report Section M*

PHS will conduct a comparison with prior surveys after smooth tides are applied to the raw data.

A 1:10,000 scale plot in fathoms was made to facilitate a cursory comparisons of hydrographic soundings to prior surveys.

Comparison were made between H-10587 and the following prior surveys:

Registry Number	Survey Scale	Survey Date
H-2110	1:4,800	Apr.-May, 1892
H-4586	1:10,000	May-Nov., 1926 ✓
H-5160	1:10,000	October, 1931
H-6649	1:10,000	Nov.-Dec., 1940

There are many cultural features that have changed along the shoreline. The significant discrepancies of shoreline features are addressed in Section J(Shoreline) of this DR. Prior survey items that were not on the DM are plotted on the field shoreline plot in red. Disprovals of prior survey items are plotted on the field shoreline plot in blue.

The following additional changes were noticed during comparison with the priors:

The north shore of Ediz Hook has been built up with Rip-Rap and some accretion to the east end of Ediz Hook has occured. These changes are evident when compared with the priors. The DM adequately depicts the new shoreline in this area. *concur*

The prior survey depth contours on H-5160 showed excellent agreement when compared with the current hydrography with the exception of two areas in the vicinity of the Rayonier ITT plant where shoaling has occurred. One shoal area located at latitude 048°07'08.50"N, longitude 123°24'55.50"W and another shoal area located at latitude 048°07'22.00"N, longitude 123°24'24.00"W have enlarged in comparison to the prior survey.

Comparison with H-6649 indicated some deepening around the five and ten fathom contour on the south side of the harbor.

Generally most soundings on H-10587 are deeper than those depicted on H-2110.

An 8.0'(1-3/4 fathom) charted rock on H-2110 located at latitude 048°07'05.80"N, longitude 123°23'27.00"W, was developed on DN 142. A rock was located at this position with a least depth of 4.1 meters (2-1/2 fathoms) based on ~~predicted~~ *actual* tides at fix number 1314.19. It is recommended to delete the 1-3/4 fathom rock and chart contemporary hydrography. *Do not concur The 1 3/4 Fm (3.2 meters) rock has been brought forward to the smooth sheet and should be retained as charted.*

Comparison with H-4586 showed excellent agreement. ✓

N. ITEM INVESTIGATION REPORTS ✓

O. COMPARISON WITH THE CHART ✓ See Eval Report Section O

PHS will conduct a sounding comparison with the chart after smooth tides are applied.

A 1:10,000 scale plot in fathoms (plotter sheet 36) was created to facilitate a cursory comparison with Chart 18468 16th Ed., February 17, 1990 and to extend the western limit of H-10587.

There have been significant shoreline changes in several areas. Most shoreline changes have been accounted for on the digital map. Charted items that were not on the DM are plotted on the field shoreline plot in red. Disprovals of charted items are plotted on the field shoreline plot in blue.

The following additional changes were noticed during comparison with the chart:

The Stolt Sea Farm fish pen centered at latitude 048°08'22.50"N, longitude 123°25'11.00"W, is an area where hydrography or SSS coverage could not be conducted. ✓ The digital map shows dolphins around the perimeter of this fish pen. There are no dolphins, the fish pen is anchored ~~with mooring buoys.~~ Chart as shown on the ~~field shoreline plot~~ Smooth Sheet. Privately maintained lights mark the corners of this fish pen.

On the southern shoreline of Port Angeles Harbor there are charted pier ruins at latitude 048°07'14.80"N, longitude 123°25'45.40"W, which are no longer present. City officials confirmed operations were conducted within this area to remove the debris on the bottom. A development line was accomplished over these charted ruins on DN 103, Fix number's 1252-1253. There was no evidence of these charted ruins on the fathogram record nor was there any evidence of the ruins by visual inspection of the bottom by PHP personnel. The DM adequately depicts this change. concur Chart this area based on the results of the present survey.

The following table lists the center positions of log booming grounds which are currently being utilized and should be retained on Chart 18468: Concur

LATITUDE (N)	LONGITUDE (W)
48°07'04.80"N	123°24'43.10"W ✓
48°07'24.50"N	123°26'15.20"W
48°07'30.70"N	123°26'50.20"W ✓
48°07'53.10"N	123°27'34.70"W
48°08'11.50"N	123°27'10.30"W
48°08'07.60"N	123°26'41.30"W
48°08'18.00"N	123°26'00.00"W

Two "Log Booming Grounds" are not in use or have been abandoned. Delete charted "Log Booming Grounds" at the following positions: Concur

LATITUDE	LONGITUDE
48°07'10.30"N	123°25'22.20"W
48°08'03.70"N	123°27'41.00"W

Sounding comparisons

Comparison of sounding data and charted soundings were made throughout the survey in accordance with section 6.11. of the Project Instructions and sections 4.5.15. and 5.3.4. of the Hydrographic Manual.

A shoal area charted at latitude 048°06'56.10"N, longitude 123°23'28.00"W was found to have a least depth on the western edge of the shoal of 1.0 fathom (1.9 meters) located at latitude 048°06'56.72"N, longitude 123°23'29.28"W. See Eval Report Sections M & T.

The nearshore hydrography along the southern shoreline of Port Angeles Harbor appears to be slightly deeper than the charted soundings.

Hydrography from H-10587 shows good agreement with charted soundings with some indication of deepening within Port Angeles Harbor.

Numerous rocks and boulders were found inshore of the 10 fathom curve on the southeast entrance to Port Angeles Harbor. PHP recommends charting "*bldrs*" symbol at latitude 048°07'30"N, longitude 123°23'00"W. The notation 'bldrs' has been added to the smooth sheet based on the side scan sonargrams and contact plot. In addition, a note has been added to the smooth sheet to reflect this situation.

Danger To Navigation ✓

Danger to Navigation Reports for the following items were submitted: Letters attached to this report.

ITEM	DATE SUBMITTED
Submerged Wreck	March 6, 1995
Uncharted rock	May 4, 1995

P. ADEQUACY OF SURVEY See Eval Rpt, section P

Mainscheme hydrographic line spacing of 100 meters was run throughout the survey limits. A SSS linespacing of 75 meters was run perpendicular to the mainscheme. Developments where conducted where needed or required. South of latitude 048°07'12.00"N was too shallow for SSS operations and the sounding spacing for this area exceeds required guidelines as specified in Sections 4.3.4, 4.3.5, and 4.3.6 of the Hydrographic Manual and Hydrographic Survey Guideline # 69, but is adequate to delineate the submarine relief for the intended use. This survey is complete and adequate to supersede prior surveys within their common areas. Concur However, there are several shoal indications inside the 10-meter depth curve, that were not developed to obtain a least depth.

Q. AIDS TO NAVIGATION ✓ See Eval Rpt, section Q

All aids to navigation, private aids and landmarks within the limits of H-10587 were positioned as specified in Section 4.2 of the project instructions.

The following new USCG and private aids to navigation were positioned to hydrographic standards:

Description	FIX	Latitude	Longitude
Yellow Light & Daymarker	6317	48°08'22.42"N	123°24'42.38"W
Green light & Daymarker "1"	6319	48°08'21.97"N	123°24'45.99"W
Red light & Daymarker "2"	6318	48°08'21.35"N	123°24'44.13"W
Green light & Daymarker "3"	6321	48°08'22.49"N	123°24'53.33"W
Red light & Daymarker "4"	6320	48°08'22.62"N	123°24'52.41"W

The supporting data on these new aids will be found in Appendix II, NOAA Form 76-40(Nonfloating Aids or Landmarks for Charts), of this report. Copies attached to this report.

Two private floating aids were not found. The Stolt fish pens mentioned in section "O" now extend to these positions. Delete the following charted aids: See attached copies of NOAA Form 76-40.

Description	FIX	Latitude	Longitude
Yellow light Y "G"		48°08'22.00"N	123°25'01.00"W
Yellow light Y "A"		48°08'23.00"N	123°25'01.00"W

R. STATISTICS

Description	Quantities
Total Positions	3156
Total Number of Selected Soundings	16593
Total Detached Positions	234
Total Bottom Samples	18
Total Nautical Miles 200% SSS	131.24
Total Nautical Miles Hydrography	290.07
Square Nautical Miles Hydrography	8.5
Velocity Casts	6
Days of Production	29

S. MISCELLANEOUS

Bottom samples were obtained in accordance with Section 6.7 of the Project instructions, sections 1.6.3 and 4.7.1 of the Hydrographic Manual. No differences in charted bottom characteristics were npticed. Reference Section O., regarding recommendation of "Blds" notation at Southeast entrance to Port Angeles Harbor.

A significant break in hydrographic data acquisition occurred from March 2 (DN 061) until March 20 (DN 079) due to the haulout of VN 1101 for annual repairs.

While acquiring SSS data during the course of this survey, it was noticed that there were numerous areas where the bottom was scattered with water-logged timber. Most of the areas found in this condition were in or around the vicinity of log booming grounds. These areas are not considered to be dangerous to the mariner because of the general locations of this debris. The areas which have scattered timber on the bottom are mainly within the presently active log booming grounds. No charting recommendations are suggested here. Limits of the log booming grounds have been shown on the smooth sheet where warranted.

The loading pier charted at latitude 048°08'25.00"N. longitude 123°26'39.00"W and positioned on DN 060 at Fix Number 6380 and Fix Number 6384 is scheduled to be permanently removed in the summer of 1995. This feature is shown on the smooth sheet and should continue to be charted unless more current information is available.

No unusual magnetic variations were observed during the course of this survey.

T. RECOMMENDATIONS ✓ See Eval Report Section T.

Chart 18468 shows only the 1-, 2-, 3-, and 5-fathom depth curves. It is suggested that the 10-, 15-, 20-, 25-, and 30-fathom depth curves be applied on this chart due to the large volume of deep-draft vessels transiting and mooring within the harbor. The added contours will better depict the bathymetry in the anchorage areas. The 1, 2, 3, and 5 Fathom depth curves have been those selected for Chart raster 18468. Application of additional depth curves have been left to the discretion of the Nautical Charting Division. (mco)
Current diver technology is significantly more accurate than wire drag methods. There should be separate chart symbols differentiating dive investigation depths and wire drag clearance depths.

U. REFERRAL TO REPORTS ✓

Coast Pilot Report	March, 1995
Horizontal Control Report	September, 1994

Submitted for approval,

Reginald W. Adams, Jr.
Survey Technician
Survey, OIC

Approved and forwarded,

Richard A. Fletcher
Lieutenant, NOAA
Chief of Party

January 24, 1995

USER CONTACT

LT Rick Fletcher and ST Reggie Adams held a meeting with representatives from the Port of Port Angeles, City of Port Angeles, Port Angeles Marina and Black Ball Transport regarding the progress of survey operations on the Port Angeles project and survey requirements for sheet A "Port Angeles Harbor".

Attendees:

Name	Organization	Phone #
Dave Callantine	Port of Port Angeles	457-8812
Gary Kenworthy	City of Port Angeles	457-0411 X-129
Chuck Faires	Port Angeles Marina	452-4505
Wayne Barrett	Black Ball Transport	457-4491

No items of concern were identified. Mr. Kenworthy was interested in having us position the end of the sewer outfalls. Some local knowledge was gained regarding changes to shoreline and possible uncharted obstructions.

1) An uncharted wreck lies outside the marina entrance.
2) A large anchor was placed off the main Port wharf.
3) Several changes to shoreline

The crane wreckage on found survey on H-10564 was identified as the crane lost approximately 3 years ago by the Mansen Construction Company of Seattle. The fishing vessel located on H-10564 was identified as a vessel that also sank approximately 3 years ago; the vessel's master was rescued by the U.S.C.G. and the vessel name is unknown.

A quick visit was made to the Port Angeles Pilot Station. PHP briefed the pilots on survey progress and supplied the positions of obstructions reported as Dangers to Navigation. No items of concern were identified.

May 2, 1994

Captain Charles R. Brown, USCG
Commanding Officer, USCG Group/Air Station
Port Angeles, WA 98362

Dear Captain Brown:

I respectfully request logistical support for the United States Coast and Geodetic Survey, Pacific Hydrographic Party (PHP) during our upcoming project at Port Angeles which is scheduled to begin in late June and continue through November.

The attached information sheet outlines PHP's functions. PHP will be conducting a hydrographic survey of the port of Port Angeles and the surrounding waters to update the nautical charts for the area. This project is in response to requests from the Puget Sound Pilots and the Port of Port Angeles.

During a reconnaissance trip to the Port Angeles area in March, the PHP Assistant Chief Lieutenant Richard Fletcher, NOAA, found your facility to be the best location for PHP to set up a base for survey operations. We are looking for the following support:

Level, paved or gravel parking space for two office trailers, approximately 45'x 30'.
200A-110V AC power source for office trailers.
Daytime use of bathrooms for 6 personnel or permission for a porta-potty.
Parking space for two small boats on trailers, 26' trailers.
Parking space for two government trucks.
Daytime parking space for 6 personal vehicles.
Pier space for a 30' survey launch and 110 VAC shore power hookup or proximity to a 110 V outlet.
The ability to install two phone lines.
The ability to broadcast marine VHF and NOAA frequency (approximately 170 MHZ) VHF radio to our boats in the survey area.

If you have any other logistical questions please contact myself or Lieutenant Richard Fletcher at (206) 293-1379.

Sincerely,

Lieutenant Guy T. Noll, NOAA
Chief

Who we are:

Department of Commerce
National Oceanic and Atmospheric Administration
National Ocean Service
Coast & Geodetic Survey
Nautical Charting Division
Hydrographic Surveys Branch
Pacific Hydrographic Section
Pacific Hydrographic Party, N/CG2453

Our mission:

Provide hydrographic ("measure of water depth") survey information for the maintenance of nautical charts. Nautical charts are published by NOS for helping the mariner transit the territorial waters of the US using prudent seamanship. NOAA is liable for the accurate and precise portrayal of the bottom topography. Thus, our surveys meet the standards promulgated by NOAA and the International Hydrographic Organization based in Monaco.

How we perform our mission:

We use a high-precision Differential Global Positioning Satellite system for positioning our 29 and 23-foot launches on the bay. A digital fathometer measures the depth beneath the launch, and the depth and position data are time-correlated to give us the depth at the known location. A systematic cross-sectioning of the bay and its features allows us to produce a plot of a small representative sample (<10%) of our data which is used to update the chart of the area after further processing in Seattle and Silver Spring, MD.

Dear Sir:

The NOAA Pacific Hydrographic Party has discovered a potential danger to navigation while conducting survey operations in Port Angeles Harbor in the Strait of Juan de Fuca. A Danger to Navigation Report is enclosed along with a chartlet showing the affected portion of Chart 18468.

I recommend this Danger to Navigation be included in the next Local Notice to Mariners.

Sincerely,

Lieutenant Richard A. Fletcher, NOAA
Chief of Party

REPORT OF DANGER TO NAVIGATION

Hydrographic Survey Registry Number: H-10587

Survey Title:

State: WA

General Locality: Strait of Juan de Fuca

Sublocality: Port Angeles Harbor

Project Number: OPR-N251-PHP

The following item which is a potential danger to navigation was discovered during hydrographic survey operations by the NOAA Pacific Hydrographic Party.

Object Discovered: A submerged wreck 45 feet in length, rising four meters from the bottom was located at latitude 48°07'40.410"N, longitude 123°27'10.691"W. Dive investigation confirmed a least depth of 8.0 meters(4.4 fathoms) at MLLW based on ~~predicted~~ actual tides. This depth plots to the northwest of the boat haven entrance and to the southeast of a commercial pier handling deep-draft vessels.

Affected nautical charts:

Chart Number	Edition No. Date	Reported Depth	Chart Datum	Geographic Position Latitude	Longitude
18468	16th Feb. 17, 1990	4 1/2 fm	NAD83	48°07'40.410"N	123°27'10.691"W

HORIZONTAL DATUM

The horizontal reference datum of this chart is North American Datum of 1983 (NAD 83) which for charting purposes is considered equivalent to the World Geodetic System 1984 (WGS 84). Geographic positions referred to the North American Datum of 1927 must be corrected an average of 0.667" southward and 4.673" westward to agree with this chart.

NOTE A

Navigation regulations are published in Chapter 2, U.S. Coast Pilot 7. Additions or revisions to Chapter 2 are published in the Notices to Mariners. Information concerning the regulations may be obtained at the Office of the Commander, 13th Coast Guard District in Seattle, Wash., or at the Office of the District Engineer, Corps of Engineers in Seattle, Wash.

Refer to charted regulation section numbers.

SUPPLEMENTAL INFORMATION

Consult U.S. Coast Pilot 7 for important supplemental information.

AIDS TO NAVIGATION

Consult U.S. Coast Guard Light List for supplemental information concerning aids to navigation.

CAUTION

Temporary changes or defects in aids to navigation are not indicated on this chart. See Notice to Mariners.

INSTRUCTIONS FOR ENTRIES UNDER 'METHOD AND DATE OF LOCATION'

(Consult Photogrammetric Instructions No. 64,

OFFICE

I. OFFICE IDENTIFIED AND LOCATED OBJECTS

Enter the number and date (including month, day, and year) of the photograph used to identify and locate the object.

EXAMPLE: 75E(C)6042
8-12-75

FIELD

I. NEW POSITION DETERMINED OR VERIFIED

Enter the applicable data by symbols as follows:

F - Field	P - Photogrammetric
L - Located	Vis - Visually
V - Verified	
1 - Triangulation	5 - Field identified
2 - Traverse	6 - Theodolite
3 - Intersection	7 - Planetable
4 - Resection	8 - Sextant

A. Field positions* require entry of method of location and date of field work.

EXAMPLE: F-2-6-L
8-12-75

*FIELD POSITIONS are determined by field observations based entirely upon ground survey methods.

FIELD (Cont'd)

B. Photogrammetric field positions** require entry of method of location or verification, date of field work and number of the photograph used to locate or identify the object.

EXAMPLE: P-8-V
8-12-75
74L(C)2982

II. TRIANGULATION STATION RECOVERED

When a landmark or aid which is also a triangulation station is recovered, enter 'Triang. Rec.' with date of recovery.

EXAMPLE: Triang. Rec.
8-12-75

III. POSITION VERIFIED VISUALLY ON PHOTOGRAPH

Enter 'V-Vis.' and date.

EXAMPLE: V-Vis.
8-12-75

**PHOTOGRAMMETRIC FIELD POSITIONS are dependent entirely, or in part, upon control established by photogrammetric methods.

OBSERVED:

POSITIONED BY: DGPS

METHOD OF INVESTIGATION: Echo sounder, Side Scan Sonar coverage. Area is covered by 200% SSS from fix number's 5679-5730 and 6405-6435, and 50-meter spaced echosounder lines.

FINDINGS: There were no significant bottom profiles which showed any shoaling areas within the confines of this awois search area. There were no significant contacts found within the confines of this awois search area. Larry Signani, Chief, Field Operations, Survey Branch, U.S. Army Corps of Engineers (COE) verified that the disposal area has not been used recently and would prefer to retain the disposal area on the chart. Mr. Signani can be reached at (206) 764-3535 for further information.

CHARTED:	048°07'03.70"N	123°24'41.30"W	Offshore end
OBSERVED:	048°07'01.03"N	123°24'45.71"W	1209

POSITIONED BY: DGPS

METHOD OF INVESTIGATION: Echo sounder, visual inspection.

FINDINGS: Fix number 1209 is the position of a single dolphin at the southern apex of a log boom. Awois 52103 is within the parameters of the log boom which was full throughout the course of this survey. The row of pilings were verified visually. See photograph.

****

DIVING INVESTIGATION

None.

****

CHARTING RECOMMENDATIONS: Chart as shown on field shoreline plot. Do not concur. Retain as charted.

GEOGRAPHIC POSITION

	LATITUDE	LONGITUDE	POSITION#
CHARTED:	048°07'07.50"N	123°24'35.20"W	Offshore end
OBSERVED:	048°07'07.51"N	123°24'35.20"W	1210
	048°07'06.79"N	123°24'36.13"W	1211

POSITIONED BY: DGPS

METHOD OF INVESTIGATION: Echo sounder, visual inspection, Side Scan Sonar coverage was unattainable due to the constraints of the geographic area.

FINDINGS: Fix number 1210 is a disproval D.P. of the offshore-most dolphin of this group. Fix number 1211 is now the offshore-most dolphin of three. Apparently two of these dolphins have been removed while three still remain. See photograph.

****

GEOGRAPHIC POSITION

	LATITUDE	LONGITUDE	POSITION #
CHARTED:			
OBSERVED:	048°07'40.41"N	123°27'10.69"W	6309

POSITIONED BY: DGPS

METHOD OF INVESTIGATION: Echo sounder, Side scan sonar, Diver investigation.

FINDINGS: On DN 059 a dive investigation was conducted after SSS records and local knowledge supported the report of the fishing vessel "Prosper" which sank approximately 3 years ago. An echo sounder return of contact # 5384.04P revealed an obstruction on the bottom approximately 4 meters off the bottom. Dive investigation concluded that there is a submerged wreck 45' in length lying upright 120° true bearing. Fix number 6309 is the resulting position taken over the least depth height of the object. A Danger to Navigation was reported and sent to proper authorities because of the close proximity to the entrance to the Port Angeles Boat Haven and the close proximity of a deep draft vessel pier.

OBSERVED:	048°08'20.00"N	123°24'21.00"W	1147-1152

POSITIONED BY: DGPS

METHOD OF INVESTIGATION: Echo sounder, visual inspection, telephone conversation.

FINDINGS: A charted platform pier with several dolphins were removed by General Construction in November, 1994 under contract with the Corps of Engineers, in association with the USCG Port Angeles Group. LT CDR Jerry Dimetria of the US Coast Guard Group Port Angeles confirmed the removal of the pier and existing dolphins during contract work conducted by General Construction in November, 1994. Additional Echo sounder coverage was performed by PHP to confirm the complete removal of these structures. 25-meter development lines were run within the vicinity of the charted structures with no submerged obstructions observed. Side Scan Sonar was run in the vicinity of these charted structures as well with no significant contacts observed. Additional information as needed should be referred to LT CDR Jerry Dimetria at (360)-457-2250.

SURVEY H-10587

Standard field surveying and processing procedures were followed in producing this survey in accordance with the Hydrographic Manual, Fourth Edition; the Hydrographic Survey Guidelines; and the Field Procedures Manual, as updated for 1995. The data were reviewed daily during acquisition and processing.

The digital data and supporting records have been reviewed by me, are considered complete and adequate for charting purposes, and are approved. All records are forwarded for final review and processing to N/CG245, Pacific Hydrographic Section.

Approved and Forwarded,

DATE: June 9, 1995

EVALUATION REPORT

H-10587

A. PROJECT

Project information is discussed in the hydrographer's report.

B. AREA SURVEYED

This survey was conducted in Washington, and is located along the west side of the Strait of Juan de Fuca and inside Port Angeles Harbor. Specifically, the surveyed area is bounded by latitude 48/08/51N to the north and includes all of Port Angeles Harbor. The eastern limit is longitude 123/22/39W and the western limit is longitude 123/27/57W. Depths range from -1.5 meters to 86 meters.

C. SURVEY VESSELS

Survey vessel information is found in the hydrographer's report.

D. AUTOMATED DATA ACQUISITION AND PROCESSING

Survey data were processed using the same Hydrographic Data Acquisition/Processing System (HDAPS) software used by the hydrographer, the Hydrographic Processing System (HPS) and AutoCad, Version 12.0.

At the time of the survey certification the format for transmission of digital data had not been formally approved. In the interim, digital data for this survey exists in the standard HPS format which is a database format using the .dbf extension. In addition, the sounding plot was created with .dbf (extension) and enhanced using the AutoCad system, are filed both in the AutoCad drawing format, .dwg (extension); and in the more universally recognized graphics transfer format, .dxf (extension). Copies of these files will be retained at PHS until data transfer protocols are developed and improved.

The drawing files necessarily contain information which is not part of the HPS data set such as geographic names text, line-type data, and minor symbolization. In addition, those soundings deleted from the drawing for clarity purposes, remain unrevised in the HPS digital files to preserve the integrity of the original hydrographic data set. Cartographic codes used to describe the digital data are those authorized by Hydrographic Survey Guideline No. 75.

The field sheet parameters have been revised to center the hydrography on the office plot. The data is plotted using a Modified Transverse Mercator projection and are depicted on a single sheet.

E. SONAR EQUIPMENT

Side scan sonar was used on survey H-10587. Refer to section E of the hydrographer's report concerning set-up, operation and processing of survey data.

F. SOUNDING EQUIPMENT

Sounding equipment is discussed in the hydrographer's report.

G. CORRECTIONS TO SOUNDINGS

The sounding data have been reduced to Mean Lower Low Water (MLLW). The reducers include corrections for an actual tide, dynamic draft, and sound velocity. These reducers have been reviewed and are consistent with NOS specifications. Actual tide reduction is derived from the Port Angeles, Washington, gage 944-4090.

H. CONTROL STATIONS

Control stations are discussed in the hydrographer's report and separates. A list of control stations used on survey H-10587 is attached to this report.

The positions of horizontal control stations used during hydrographic operations are field values based on NAD 83. The geographic positions of all survey data are based on NAD 83. The smooth sheet is annotated with an NAD 27 adjustment tick based on values determined with the NGS program NADCON.

Data based on NAD 27 may be referenced to this survey by applying the following corrections:

Latitude:	-0.674 seconds	(-20.821 meters)
Longitude:	4.669 seconds	(96.538 meters)

I. HYDROGRAPHIC POSITION CONTROL

Differential GPS (DGPS) was used to control this survey. A horizontal dilution of precision (HDOP) not to exceed 3.75 was computed for survey operations. The quality of several positions exceeds limits in terms of horizontal dilution of precision (HDOP). These positions are isolated and occur randomly throughout the survey area. A review of the data, however, suggests that none of these fixes are used to position dangers to navigation. The features or soundings located by these fixes are consistent with the surrounding information. These fixes are considered acceptable.

J. SHORELINE

The following digitally compiled shoreline map on NAD 83 applies to this survey.

Map Number	Photo Date	Scale
DM-10158	July 1991	1:20,000

The shoreline drawn on the smooth sheet originates from a 1:20,000 scale digital file provided by the Coastal Mapping Program. This file has been merged with the survey file during ACAD processing. Changes to alongshore and offshore features shown on the shoreline maps were verified and revised as warranted during survey operations. These changes have been shown on the smooth sheet.

There was one revision (breakwater) to the mean high water line at latitude 48/08/22 N, longitude 123/24/41 W.

K. CROSSLINES

Crosslines are discussed in the hydrographer's report.

L. JUNCTIONS

Survey H-10587 junctions with the following survey.

Survey	Year	Scale	Area
H-10583	1995	1:10,000	west, north, and east

The junction with survey H-10583 is complete. Soundings and depth curves are in good agreement within the common area.

M. COMPARISON WITH PRIOR SURVEYS

H-2110 (1892) 1:4,800
H-4586 (1926) 1:10,000
H-5160 (1931) 1:10,000
H-6649 (1940) 1:10,000

The prior surveys listed above cover the entire area of the present survey. Sounding agreement is good, with the present survey depths deeper between 1 and 2 meters. Differences can be attributed to increased bottom coverage and less accurate positioning and sounding methods available between 1892-1940. Shoreline changes since 1926 are most notable along the southern and western shores of Port Angeles Harbor. In these areas , there has been new pier construction and associated fill activities to build up the surrounding shoreline. The shoreline along the north and south sides of Ediz Hook has remained stable and reflects little change.

The features listed below have been brought forward from the following prior surveys.

Feature	Latitude	Longitude	Prior Survey
rock	48/06/53.80	123/23/07.34	H-6649
rock	48/06/54.12	123/23/08.07	"
rock	48/06/53.80	123/23/09.04	"
rock	48/06/53.73	123/23/11.22	"
0.3 sdg.(1/6 FM)	48/07/05.18	123/24/57.62	H-5160
6.7 sdg.(3 4/6 FM)	48/08/25.96	123/25/37.68	"
31 sdg.(17 FM)	48/08/23.40	123/25/42.53	"
11.3 sdg.(6 1/6 FM)	48/08/25.96	123/25/43.99	"
7 sdg.(3 5/6 FM)	48/08/26.45	123/25/48.84	"
25.6 sdg.(14 FM)	48/08/24.08	123/25/50.20	"
42 sdg.(23 FM)	48/08/22.39	123/25/58.07	"
49 sdg.(27 FM)	48/08/20.77	123/26/20.93	"
27 sdg.(15 FM)	48/08/25.25	123/26/22.87	"
11.6 sdg.(6 2/6 FM)	48/07/34.47	123/26/52.24	"
11.6 sdg.(6 2/6 FM)	48/07/30.84	123/26/51.27	"
3.2 Rk (1 3/4 FM)	48/07/06.13	123/23/28.23	T-2110

With the exception of the above, survey H-10587 is adequate to supersede the prior surveys within the common area.

N. ITEM INVESTIGATIONS

There were 57 AWOIS items assigned to this survey. With the exception of AWOIS items 52068, 52069, 52081, 52084, 52088, and 52089 these items have been adequately addressed and disposed of in the hydrographer's report. Four additional items found during the survey were investigated and have been adequately addressed by the hydrographer.

O. COMPARISON WITH CHART

Survey H-10587 was compared with the following chart.

Chart	Edition	Date	Scale	Datum
18468	16th	February 17, 1990	1:10,000	NAD83

a. Hydrography

Charted hydrography originates with the above mentioned prior surveys and miscellaneous sources and requires no further discussion except as follows:

A 3/4 fathom sounding in the vicinity of lat. 48/08/04.5 N, lon. 123/27/42.0 W and a group of five rocks in the vicinity of lat. 48/06/56.5 N, lon. 123/23/28.0 W both of miscellaneous origin were not verified during the survey and should be retained as charted.

Depths	Latitude	Longitude
9 FM	48/08/25.6	123/25/54.0
9 FM	48/08/25.5	123/26/04.5
8 FM	48/08/28.0	123/26/12.5
7 FM	48/08/27.5	123/26/20.5
5 1/4 FM	48/07/31.5	123/26/47.0
1 1/2 FM	48/07/03.5	123/24/43.0
1 FM	48/07/02.0	123/24/38.0

Except as noted above, survey H-10587 is adequate to supersede charted hydrography within the common area.

b. Dangers to navigation

The hydrographer reported two dangers to navigation during survey operations. These dangers were reported to the local United States Coast Guard District, DMAHTC, and N/CS261. Copies of these reports are attached. No additional dangers were submitted during office processing.

P. ADEQUACY OF SURVEY

Hydrography contained on survey H-10587 is adequate to:

a. delineate the bottom configuration, determine least depths, and draw the required depth curves;

b. reveal there are no significant discrepancies or anomalies requiring further investigation; and

c. show the survey was properly controlled and soundings are correctly plotted.

Except as noted below, the hydrographic records and reports received for processing are adequate and conform to the requirements of the Hydrographic Manual, 4th Edition, revised through Change No. 3, the Hydrographic Survey Guidelines, and the Field Procedures Manual, April 1994 Edition.

Several AWOIS items listed in section N were not adequately disposed of during survey operations. Four of these items are log booming areas where conventional hydrography and or side scan operations could not be conducted. AWOIS items 52081 and 52084 are charted pier/dock ruins that were not addressed.

Refer to the hydrographer's report, section P, regarding that portion of the survey area exceeding line spacing requirements and lack of side scan sonar coverage.

Q. AIDS TO NAVIGATION

Three buoys, five new lights, and seven privately maintained lights were located by the hydrographer. Port Haven Light (Light #16330) was not located by the hydrographer and its charting position was provided by the US Coast Guard and plotted on the smooth sheet. The existence of this light was visually verified by the hydrographer. The hydrographer also found out that the four markers for the 1/10 nautical mile speed check no longer exist and should be deleted from the chart. The charted light at Ediz Hook and eight landmarks were not verified by the hydrographer. These features has been digitized as part of the shoreline manuscript and graphically portrayed on the smooth sheet. The charted radio mast was visually verified by the hydrographer and recommends that it be retained as charted. The four privately maintained lights located on Stolt Sea Farm are on the corners of the floating fish pen.

R. STATISTICS

Statistics are itemized in the hydrographer's report.

S. MISCELLANEOUS

Miscellaneous information is discussed in the hydrographer's report.

T. RECOMMENDATIONS

This is a good hydrographic survey. Additional work is recommended on a low priority basis to prove or disprove the existence of charted items from prior surveys and miscellaneous sources listed in sections M, N, and O.

U. REFERRAL TO REPORTS

Referral to reports is discussed in the hydrographer's report.

Leonardo T. Deodato
Cartographer

APPROVAL SHEET
H-10587

Initial Approvals:

The completed survey has been inspected with regard to survey coverage, delineation of the depth curves, development of critical depths, cartographic symbolization, comparison with prior surveys and verification or disproval of charted data. The digital data have been completed and all revisions and processing have been entered in the magnetic tape record for this survey. The survey records and digital data comply with NOS requirements except where noted in the Evaluation Report. Final control, position and sounding printouts have been included with the survey records.

Bruce A. Olmstead Date: 4/15/96
Bruce A. Olmstead
Senior Cartographer, Cartographic Section
Pacific Hydrographic Branch

I have reviewed the smooth sheet, accompanying data, and reports. This survey and accompanying digital data meet or exceed NOS requirements and standards for products in support of nautical charting except where noted in the Evaluation Report.

Kathy Timmons Date: 4/19/96
Kathy Timmons
Commander, NOAA
Chief, Pacific Hydrographic Branch

INSTRUCTIONS

A basic hydrographic or topographic survey supersedes all information of like nature on the uncorrected chart.
1. Letter all information.
2. In "Remarks" column cross out words that do not apply.
3. Give reasons for deviations, if any, from recommendations made under "Comparison with Charts" in the Review.
